Purpose of this Document

This Administrative Guide provides an introduction to and an overview of the two-day instructional module entitled "Advanced Roadside Impaired Driving Enforcement" (A-RIDE). This module can be taught in a Drug Evaluation and Classification Program (DEC) State, or a State that currently does not support the DEC Program.

The curriculum is designed to be delivered as a stand-alone course. The program of instruction is intended for delivery to as many of the nation's traffic law enforcement officers as possible. This curriculum is designed to help those officers become more proficient at detecting; apprehending, testing and prosecuting impaired drivers. The module's subject matter relates to two curriculums, the "Standardized Field Sobriety Testing" and "Drug Evaluation and Classification."

A qualified DRE is a specially skilled individual who can examine a person suspected of drug impairment and determine, with a high degree of accuracy, the broad category (or combination of categories) of drugs causing the impairment. A DRE does their specialized work only after a suspect has been apprehended (for DWI or some other offense), and only when there is probable cause to continue with an investigation.

This course will offer additional information to law enforcement officers on detecting impairment caused by more than just alcohol. Often times law enforcement officers that have not received advanced or in-service training regarding drug impairment tend to not be able to identify these characteristics; therefore they will release an impaired driver. Once an officer completes the training he/she will be more proficient with the 3 battery of tests (HGN,WAT,OLS), as well as a broader knowledge of drug impairment indicators. The law enforcement officer will also be more familiar with the DRE program and its function. This will facilitate better communication and transfer of critical roadside indicators of impairment to the evaluating DRE officer for a more complete and accurate assessment of the impairment.

This Administrative Guide is intended to facilitate planning and implementation of the A-RIDE Course. This course consists of 8 sessions. It overviews the sequence of instruction, documents the materials and the teaching aides that make up the instructional package, describes course administrative requirements, and provides guidelines for discharging those requirements satisfactorily.

The Guide sets forth the fundamental tasks that make up the job of DWI enforcement, and identifies knowledge; skills and attitudes police officers need to perform those tasks well. The Guide also outlines the preparatory work that must be accomplished (primarily at the departmental or academy level) before the course can be conducted, and outlines the follow-up work that should be undertaken, subsequent to training, to ensure that the desired outcomes of the training are realized.

A. For whom is the training intended?

This module is designed primarily for law enforcement officers that meet the IACP/NHTSA National Standardized Field Sobriety Testing Program Standards, including a proficiency test, and who have successfully completed an IACP/NHTSA approved training course.
The officer must be able to administer and interpret the horizontal gaze nystagmus (HGN) test for alcohol-impaired suspects. The student should be fully conversant with the procedural "mechanics" of HGN with the three clues of HGN and with the interpretation of those clues for assessing alcohol impairment. A major focus of this module is on the examination of a drug-impaired suspect’s eyes. The procedures for those eye examinations derive largely from HGN procedures.

Students should be a State Certified or Commissioned law enforcement officer in a full time paid capacity and/or prosecutors responsible for the detection, arrest, and prosecution of DWI drivers. Officers and Prosecutors selected to attend this training should be aware of the hazards caused by impaired drivers, motivated to arrest and prosecute impaired drivers, and their duty assignments will enable them to spend the time required to process DWI offenders.

Students applying to or scheduled to attend should be familiar with the extent of the drug impaired driving problem, must have successfully completed the basic Standardized Field Sobriety Testing course, and attended a recent SFST Refresher or Update course.

This course was not designed to be offered in a basic academy to new police recruits. This is an intermediate level course designed to offer more than a basic understanding of the impairing effects of drugs (Illicit and Licit), alcohol, and/or the combination of both.

B. Instructor Qualifications.

NHTSA / IACP highly recommend that principal instructors for this course should be state-qualified and IACP-credentialed Drug Recognition Expert Instructors. That means that they (1) hold currently valid certificates as DREs; (2) have completed the NHTSA/IACP DRE Instructor Training Course; and, (3) have completed the required delivery of both classroom and certification training, under the supervision of credentialed DRE instructors. At minimum a qualified DRE with instructor credentials in other fields of occupational competency (not necessarily a DRE instructor) can be utilized to present ARIDE materials if instructor resources are limited and can not be resolved at the state coordinators level without undue hardship.

A qualified SFST instructor could instruct segments one through three leading to the preparation and evaluation of participants during the SFST proficiency examination.

In addition to their occupational competencies, all instructors must be qualified teachers. They need to understand, and be able to apply, fundamental principles of instruction. Perhaps most importantly, they need to be competent coaches. Much of the classroom training is devoted to hands on practice. The quality of coaching will have a major impact on the success of those practice sessions. It is highly recommended that every instructor be a graduate of the NHTSA/IACP DRE instructor Training Course.

However, some agencies may wish to enlist instructors with special credentials for certain blocks of instruction. For example, a physician would be well qualified to assist/teach session IV, and a prosecutor might be a good choice for session VIII.

C. Curriculum Objectives

Session I deals specifically with Drugs, Drug Impaired Driving, and how it relates to Highway Safety. The session objectives are:
Explain the goals and objectives of this course

Identify the elements of the drug problem

Define and describe impaired driving enforcement programs

Understand the roles and responsibilities of the Drug Recognition Expert (DRE) and how this course supports the Drug Evaluation and Classification Program (DECP)

Define the term drug in the context of traffic safety and impaired driving enforcement as referenced in the DECP

**Session II** is a very detailed review of the Standardized Field Sobriety Tests including the foundational studies and the most recent validation studies. The session objectives are:

Understand the results of selected SFST validation studies

Define and describe the Standardized Field Sobriety Tests (SFSTs)

Define nystagmus and distinguish between the different types

Describe and properly administer the three SFSTs

Recognize, document and articulate the indicators and clues of the three SFSTs

Identify the limitations of the three SFSTs

**Session III** involves SFST Proficiency. The participant will be given two opportunities to pass the NHTSA/IACP Proficiency Examination. This Session Objectives are:

Demonstrate knowledge and proficiency in administering the Standardized Field Sobriety Test Battery.

**Session IV** deals with physiology of the human body and how driving behavior is affected by the use of drugs. The session objectives are:

Describe, in general terms, the basic purpose and functions of selected major systems in the human body as they relate to observable signs.

Identify methods of ingestion and general effects of drugs.

Identify medical conditions which may mimic alcohol and drug impairment.

Identify the seven major drug categories as referenced in the DECP and the basis for dividing drugs into these specific groups.

**Session V** involves discussion of observation of eyes and other sobriety testing techniques used by law enforcement at roadside. The session objectives are:

Discuss Vertical Gaze Nystagmus: How to administer properly and describe what the results indicate.
Discuss Lack of Convergence: How to administer properly and describe what the results indicate.

Describe the difference in pupil size.

Discuss modified Romberg Balance Test: How to administer properly and describe what the results indicate.

Explain the relationship between eye examinations and the seven categories

**Session VI** involves a detailed description of the seven major drug categories and how they affect the human body and what an officer may observe with these drugs on board. The session objectives are:

- Identify common drug names and terms associated with the Major Drug categories.
- Identify the common methods of ingestion for each category.
- Describe the general indicators of impairment associated with each category.
- Describe conditions which may mimic the signs and symptoms associated with each major drug category.
- List the indicators which may emerge during the three phases of the DWI detection process (vehicle in motion, personal contact & pre-arrest screening) which may indicate the subject is under the influence of a drug(s).

**Session VII** involves the possible combinations of drugs that are most commonly seen by law enforcement and what the indicators of impairment may be. The session objectives are:

- Describe the prevalence of drug and alcohol use (individually & in combination) as well as poly drug use
- Define poly drug use
- Articulate possible effects of poly drug use related to the general indicators of alcohol and drugs

**Session VIII** involves Pre & Post Arrest procedures and how to prepare for the prosecution of the drug and alcohol impaired driver. The session objectives are:

- Describe the three phases of the detection process: vehicle in motion, personal contact and pre-arrest screening
- Describe effective roadside interview techniques
- List the elements of the offence of DUID
- Identify the indicators of impairment observed during the three phases of the detection process
- Accurately document, in the proper event sequence order, observed impairment in each of the three phases of the detection process
Identify additional resources to support prosecution

Articulate relevant evidence as it relates to case preparation and prosecution

C. Subject Matter

This course encompasses information and techniques for addressing the drug and alcohol impaired driving problem. The following topics are discussed and/or delivered in detail throughout the entire curriculum:

Update of Standardized Field Sobriety Testing Battery.

How drug impaired driving affects our community.

SFST Proficiency Examination.

Drugs in the human body and the impairing effects they may have.

Seven categories of drugs identified by the DEC Program.

Additional sobriety tests that will provide an expanded knowledge of detection to law enforcement.

Provide and expanded knowledge of prosecuting drug impaired drivers to prosecutors and courts

D. Curriculum Package

The Advanced Roadside Impaired Driving Enforcement training curriculum consists of the following materials:

A participant manual

An instructor manual

Administrators guide

Microsoft Power Point Presentation, Sessions I-VIII

One (1) DVD/VHS, inclusive of indicators of impairment for the seven major categories of drugs.

One (1) template for a modified drug matrix chart.

Pre-course knowledge assessment

Final Exam / Scenarios
Scenario #1 (Stimulant)
Scenario #2 (Hallucinogens)
Scenario #3 (Narcotic Analgesic)
Scenario #4 (Inhalants)
Scenario #5 (Dissociative Anesthetic)
Scenario #6 (Cannabis)
Scenario #7 (Depressant & Narcotic)
Scenario #8 (Depressant & Cannabis)
Scenario #9 (Hypoglycemia Symptoms)

Instructor and course critique

In order to assess the effectiveness of the ARIDE course, it is important to obtain input from participants, like yourself, as to the course’s content, its relevance to practice, and the instructors’ effectiveness in delivering the course. Your help is needed so we can provide the best possible training. Please take a few minutes to answer the survey.

1. I was prepared for the SFST proficiency requirements associated with this course.

<table>
<thead>
<tr>
<th>Strongly Agree</th>
<th>Agree</th>

</table>

   If not, why? ___________________________________________________

   Comments: _______________________________________________________
   ________________________________________________________________
4. Based on the classroom content, I feel confident that I can identify general indicators associated with a suspected impaired driver.

   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

   If not, why? ______________________________________________________

5. Overall, the ARIDE course provided me with information which is immediately applicable to my job.

   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

   If not, why? ______________________________________________________

6. Upon completing the course, I can effectively communicate (in writing and in a courtroom setting) my observations associated with a driver who I suspect is impaired by alcohol, drugs or a combination of both.

   Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree

   Comments: ______________________________________________________

7. If one section of the ARIDE curriculum could be removed/abbreviated, it should be:

   _________________________________________________________________

8. If one section of the ARIDE curriculum could be expanded/emphasized, it should be:

   _________________________________________________________________

9. What information could be added to the ARIDE course to make it more applicable to your job?

   _________________________________________________________________

10. In regards to the course objectives, the length of the course (2-day or 16 hrs) was appropriate:

    Strongly Agree  Agree  Neutral  Disagree  Strongly Disagree
Based on the information presented in this course, I am confident that I can perform each of the following as part of a roadside assessment of a driver suspected of being impaired by alcohol, drugs or a combination of both:  **LAW ENFORCEMENT OFFICERS ONLY**

Session I

Introduction and Overview

“DRUGS AND HIGHWAY SAFETY”
SESSION I  Introduction and Overview  
“Drugs and Highway Safety”

Upon completion of this session, the participant will be able to:

1. Explain the goals and objectives of this course.

2. Identify the elements of the drug problem.

3. Define and describe impaired driving enforcement programs.

4. Understand the roles and responsibilities of the Drug Recognition Expert (DRE) and how this course supports the Drug Evaluation and Classification Program (DECP).

5. Define the term drug in the context of traffic safety and impaired driving enforcement as referenced in the DECP.

I. INTRODUCTION AND OVERVIEW

A. Upon successful completion of this session the participant will be able to:

1. Explain the goals and objectives of this course

2. Identify the elements of the drug problem

3. Define and describe impaired driving enforcement programs

4. Understand the roles and responsibilities of the Drug Recognition Expert (DRE) and how this course supports the Drug Evaluation and Classification program (DEC)

5. Define the term drug in the context of traffic safety and impaired driving enforcement as referenced in the DEC program

Many law enforcement officers are trained in Standardized Field Sobriety Testing (SFST) and use the skills gained in the course as part of their overall enforcement of DWI laws.

This course is not developed to act as a substitute for the DEC program and will not qualify or certify an individual as a DRE.
This course is intended to bridge the gap between the SFST and DRE course and to provide a level of awareness to the participants, both law enforcement and other criminal justice professionals, in the area of drug impairment in the context of traffic safety.

Based on that premise, the ARIDE course was developed with the following goals in mind:

II. COURSE GOAL

This course will train law enforcement officers:

1. To observe
2. Identify
3. Articulate

The signs of impairment related to drugs, alcohol or a combination of both in order to reduce the number of impaired driving incidents, serious injury, and fatal crashes.

and

This course will train other criminal justice professionals (prosecutors, toxicologists, etc.) to:

1. Understand the signs of impairment related to drugs, alcohol, or a combination of both.
2. To enable them to effectively work with law enforcement in order to reduce the number of impaired driving incidents, serious injury, and fatal crashes.

NHTSA has promoted high visibility enforcement efforts among law enforcement agencies. As a result of this effort, several things happened:

1. Prosecutors were left behind in technology advances and training.

2. Overloaded the criminal court system.

3. Delivered poorly developed cases for prosecution.

4. Short cuts were taken that jeopardized court cases.

Criminal justice professionals such as:

1. Prosecutors
2. Toxicologists
3. Probation and Parole Officers

Must understand the impaired driving detection process in order to support enforcement efforts, which increase the probability of successful prosecution and adjudication.
In Order to meet these goals, this course will train participants to:

1. Define and describe the relationship of drugs to impaired driving incidents.

2. Demonstrate, articulate, and properly administer the SFSTs proficiently.

3. Observe, identify, and articulate the observable signs of drug impairment with the established seven drug categories associated with the DEC program.

4. Recognize possible medical conditions, which may mimic the observable signs of drug impairment.

5. Identify, document and describe indicators observed and information obtained related to impairment which leads to the arrest/release decision.

6. Articulate through testimony impairment related to alcohol, drugs, or a combination of both based on a complete investigation.

This course is divided into sessions, which are designed to provide the participant with an overview of drug impaired driving.

<td></td>
<td></td>
</tr>
</tbody>
</table>

In order for the participant to utilize the information presented in this course, NHTSA will require a prerequisite:

1. The student will receive a short review and update for the SFSTs as part of Session II of this course.

2. After completing that session, the student will be required to pass a SFST proficiency evaluation.

3. Failure to successfully complete the SFST proficiency will result in dismissal from the course.

4. The participant will be given two opportunities to successfully complete the SFST proficiency; under no circumstance will the participant be allowed to complete the training without satisfactory completion of the proficiency examination.

It is recommended that a different instructor administer the second SFST proficiency examination, if necessary.
III. WHAT IS A DRUG?

There are many definitions for the word drug:

Charles Levinthal’s text, *Drugs, Behavior and Modern Society*, offers a general definition:

which describes a drug as a chemical substance that, when taken into the body, alters the structures or functioning of the body in some way, excluding those nutrients considered to be related to normal functioning.

NHTSA’s impaired driving training programs require a more specific definition since the ultimate goal is to decrease impaired driving incidents, serious injury, and fatal crashes.

For the purpose of this course and subsequent courses (DEC):

- A drug is defined as any substance, which when taken into the human body, can impair the ability of the person to operate a vehicle safely.

Note: It should be noted that each state may have specific criteria related to the definition of a drug. Students should become familiar with their state’s specific statutes in this area.

The student will be required to restate this definition verbatim on the final exam.
IV. ALCOHOL AND DRUG USE

Social drinking is considered acceptable in many societies.

It is important to understand the use of alcohol in the context of society, since it is related to the enforcement and adjudication of DWI offenses.

The National Survey on Drug Use and Health (NSDUH) Survey reports that:

- 119 million (50.1%) people consider themselves drinkers
- 14% of this group describe themselves as heavy drinkers.
- 19.5 million people or 8.2% of the population have used illicit drugs in the past month.
- Although these statistics are significant, it is reasonable to assume that the problem is even larger when you consider legal or prescription drugs used in a manner other than for what they have been prescribed or produced.

When we look at drug use specifically, it is helpful to see the trends based on specific types of drugs.
The following summarizes the usage information as reported by the NSDUH Survey 2003:

- 14.6 million people consider themselves current marijuana user.
- 54.2% only use marijuana.
- 20.6% use marijuana in combination with other drugs.
- 75% of current illicit drug users also use marijuana.

NSDUH provides additional details on drugs used in a manner other than prescription:

<table>

</tbody>
</table>

V. DRIVING UNDER THE INFLUENCE

Understand the magnitude of the problem of individuals driving while impaired by drugs and alcohol.

? Ask class for examples specific to their state/locality?
The surveys tell us:

1. Males are twice as likely as females to drive under the influence of alcohol.

2. Overall, 13.6% or more than 32 million people reported that they had driven at least once in the last year under the influence of alcohol.

That further translated into approximately 30% of minors (16-20 years of age) and 29% of those between the ages of 21 and 25 years.

5% (11 million) of people reported that they drove under the influence of illicit drugs during the last year.

VI. IMPAIRED DRIVING ENFORCEMENT SYSTEM

NHTSA supports:

- Training
- Enforcement
- Prosecution
- Adjudication

What NHTSA Supports:

Selective Traffic Enforcement Program, (STEP) Grants, Crackdown support, Traffic Safety Resource Prosecutors (TSRP), Saturation Patrols, Sobriety Checkpoints, and Judicial Education.
One of the most critical support activities NHTSA provides is **TRAINING**.

Some examples of law enforcement and justice professional training that NHTSA provides and supports is:

- Standardized Field Sobriety Testing
- Advanced Roadside Impaired Driving Enforcement
- Drug Evaluation and Classification program
- Drug Impairment Training for Educational Professionals
- Prosecuting the Drugged Driver
- Lethal Weapon
- Protecting Lives, Saving Futures

The Standardized Field Sobriety Testing (SFST) Practitioner course provides:

- The cornerstone for a system of impaired driving training and enforcement.
- Proficiency in the SFST skills provides a foundation for this course as well as the Drug
### Evaluation and Classification (DEC) program.

- The SFST program should be part of all alcohol and drug impaired driving enforcement initiatives.

### VII. STANDARDIZED FIELD SOBRIETY TESTING PROGRAM

The SFST Battery is a set of tests that include the following:

- Horizontal Gaze Nystagmus
- Walk-and-Turn
- One-Leg Stand

These tests are designed:

- To be administered and
- Evaluated in a standardized manner to obtain validated indicators of impairment based on NHTSA supported research.

The SFSTs are part of the overall DWI detection process which includes three phases:

1. Vehicle in motion
2. Personal contact
3. Pre-arrest screening

Throughout this course we will be discussing concepts related to these three phases.
The SFST test battery serves as the foundation for impaired driving enforcement. It is critical that these tests be performed and interpreted properly.

VIII. DRUG EVALUATION AND CLASSIFICATION

The ultimate goal of the DEC program is:

1. To help prevent crashes and avoid deaths and injuries by improving enforcement of drug impaired driving violations.

The DRE officer is trained to:

1. Conduct a detailed evaluation, consisting of twelve steps (12), and obtain other evidence that can be articulated as an opinion.

A student who successfully completes all phases of the DEC program is known as a DRE.

They can reach reasonably accurate conclusions concerning the category or categories of drug(s), or medical conditions causing the impairment observed in the subject.
Based on these informed conclusions, the DRE officer can request the collection and analysis of an appropriate biological sample (blood, urine, or saliva) to obtain corroborative, scientific evidence of the subject's drug use.

The progression between each of the impaired driving enforcement programs is:

1. The foundation is SFST
2. The intermediate level is ARIDE
3. The final stage is the DEC program

*This ARIDE course is not designed as a substitute for the DEC program and will not qualify or certify an individual as a DRE.*

**IX. DRUG IMPAIRMENT TRAINING FOR EDUCATIONAL PROFESSIONALS**

The purpose of the DITEP training is:

1. To provide
   - School administrators
   - Teachers
   - Nurses
with a systematic approach to recognizing and evaluating individuals in the academic environment who are using, abusing, and/or impaired by drugs, in order to provide early intervention.

This training is not intended to qualify participants as DREs, but is intended to aid in the evaluation and documentation of those suspected of being impaired by drugs.

## X. ROLES AND RESPONSIBILITIES OF A DRUG RECOGNITION EXPERT

To obtain a DRE Certification the law enforcement officer must:

1. DRE completes 72 hours of classroom training.

2. Field certifications

3. Comprehensive final knowledge examination.

In order to retain their certification, the DRE must:

1. Participate in continuing education courses.

2. Complete a recertification training course every two years.
3. Maintain a log of all evaluations completed in training and as part of any enforcement activities.

4. Meet other administrative requirements as established in the International Association of Chiefs of Police (IACP) International Standards governing the DEC program.

5. The State DEC program state coordinators may place other standards on each DRE that is specific to that state.

XI. THE ARIDE COURSE

The ARIDE course was designed with a dual purpose:

1. The ARIDE program will allow the student to build on the knowledge gained through their training and experience related to the SFSTs.

   • Many law enforcement officers have encountered subjects who appear to be impaired by a substance other than alcohol, or seem to be displaying signs and symptoms which are inconsistent with their BAC test results.
• This course will provide additional information which can assist the officer in effective observation and interview techniques related to driving while impaired by alcohol, drugs, or a combination of both, and make an informed decision to arrest or not arrest a subject for impaired driving.

2. This course will deliver knowledge and information that will help them better assess impaired drivers at roadside.

• This training and subsequent field experience will demonstrate the value of having a DRE on staff in an agency and may serve as motivation for the individual officers to attend a DEC course in the future.

• A subsequent result of this course will facilitate better utilization of DREs in the field.

The Desired outcome of the training is:

• The student will better understand the role of the DRE and will be able to use their expertise more effectively.
• For those communities with no DREs or limited access to their services, this course will help officers make informed decisions related to testing, documentation, and reporting.
Ninety Minutes

Session II

STANDARDIZED FIELD SOBRIETY TESTING REVIEW
SESSION II Standardized Field Sobriety Testing Update and Review

Upon successfully completing this session, the student will be able to:

1. Understand the results of selected SFST validation studies.
2. Define and describe the Standardized Field Sobriety Tests (SFSTs).
3. Define nystagmus and distinguish between the different types.
4. Describe and properly administer the three SFSTs.
5. Recognize, document and articulate the indicators and clues of the three SFSTs.
6. Identify the limitations of the three SFSTs

I. STANDARDIZED FIELD SOBRIETY TESTING REVIEW

A. Upon successfully completing this session, the student will be able to:

1. Understand the results of selected SFST validation studies.

2. Define and describe the Standardized Field Sobriety Tests (SFSTs)

3. Define Nystagmus and distinguish between the different types

4. Describe and properly administer the three SFSTs

5. Recognize, document and articulate the indicators and clues of the three SFSTs

6. Identify the limitations of the three SFSTs

B. Overview of the SFST Validation Studies

For many years law enforcement officers have utilized field sobriety tests to:

- Determine a subject’s impairment due to alcohol.
The performance of the subject on those field sobriety tests was used by the officer to develop probable cause for arrest and as evidence in court.

A wide variety of field sobriety tests being used by officers throughout the country.

There was a need to develop a battery of standardized, validated tests.

Study conducted in 1975,

Sponsored by NHTSA through a contract with the Southern California Research Institute (SCRI)

SCRI conducted several research projects and published the following three reports:

- California; 1977 (Lab)
- California; 1981 (Lab and Field)
- Maryland, DC, VA, NC; 1983 (Field)
- Primary distinction (Validated at 0.10 BAC)

This may not seem important, but officers are seeing this in court as a defense strategy.
The recommended battery included the following SFSTs:

- Horizontal Gaze Nystagmus (HGN)
- Walk-and-Turn (WAT)
- One-Leg Stand (OLS)

SCRI analyzed the laboratory test data and determined that:

- HGN, alone, was 77% accurate
- WAT, alone, was 68% accurate
- OLS, alone, was 65% accurate
- Combination of HGN and WAT yield an accuracy rate of 80%

Additional research studies conducted to validate the 3-test battery at 0.08 BAC.

Three SFST validation studies were:

- Colorado (1995)
- Florida (1997)
- San Diego (1998)

The Colorado SFST validation study was the first full field study that utilized law enforcement personnel experienced in the administration of SFSTs.
The results of this study indicated that correct arrests decisions were made:

- 93% of the time based on the 3-test battery (HGN, WAT, OLS)
- Correct decisions to arrest were made 95% of the time based on the 3-test battery (HGN, WAT, OLS).

The San Diego SFST validation field study was undertaken because of the nationwide trend towards lowering the BAC limits to 0.08.

The research was done to investigate how well the SFSTs discriminate at BACs below 0.10. Based on the revised arrest and release criteria:

- The officers in the study made correct decisions 91% of the time based on the 3-test battery (HGN, WAT, OLS) at the 0.08 BAC level and above

In order to understand the results of the research studies discussed in this course, it is important to define what is meant by a correct arrest decision.

A correct arrest decision is made when an officer, after completing the third phase of the detection process:

The chart and arrest decision data is from the Colorado study.
• Decides to arrest an individual and that individual tested above the illegal per se limit.

• The officer decides to release an individual who is below the illegal per se limit.

There are four quadrants, each representing a different decision.

The quadrants (I & IV), shaded in gray, represent a correct arrest decision.

The remaining individuals, incorrect arrest decisions, fall into two other categories.

The first group was not arrested, but tested above the illegal per se limit.

The reason for no arrest decision:

• (Approximately 33%) of these individuals were considered alcohol-tolerant and performed well on the SFSTs even though their BACs were above the illegal per se limit.

The members of second group were arrested, but their BAC was below the illegal per se limit.
Many states stipulate in their statute that a driver is considered DWI if they are:

- Above the illegal per se limit.
- Lost the normal use of their mental or physical faculties.

Even though the arrests in quadrant III may be legally justifiable according to an individual state’s statute, these decisions are recorded as errors in the research based on the procedures outlined in the study.

It is important for the officer who is trained in SFST to prepare themselves to understand and explain these statistics in layman terms in order to effectively articulate them to a jury in a courtroom.

Practical Exercise:

Ask the following question:

“According to the original validation studies, is it true that 77 percent of the time HGN is accurate”?

Let student answer.
Then that means that 23 percent of the time the test is incorrect and you are arresting subjects that should not be arrested.

HGN Introduction Slide

II. OVERVIEW OF SELECTED TYPES OF NYSTAGMUS

A. Nystagmus

- Is the involuntary jerking of the eyes and is normal and occurs naturally.

Horizontal Gaze Nystagmus is defined as the involuntary jerky of the eyes, as the eyes gaze to the side.

There are over 40 different types of nystagmus, but during this course we will focus on two types of nystagmus:

- Horizontal gaze nystagmus (HGN)
- Vertical gaze nystagmus (VGN)

The ability to recognize horizontal and vertical gaze nystagmus are important tools in impaired driving enforcement.
Alcohol and certain other drugs have been shown, through research, to cause horizontal and vertical gaze nystagmus, which is visible without the aide of specialized instrumentation.

B. Categories of Nystagmus

Vestibular Nystagmus

Caused by movement or action to the vestibular system that can occur when an individual is spun around and the fluid in the inner ear is disturbed or there is a change in the fluid (temperature, foreign substance, etc.).

Pathological Nystagmus

Caused by the presence of specific pathological disorder, which include brain tumors, other brain damage, or some diseases of the inner ear.

Neural Nystagmus

Caused by some disturbance to the neural system.

In this course we will only be concerned with gazed invoked neural nystagmus.

This type of nystagmus occurs when the eye focuses on an object as they gaze towards the side.
C. Gaze Nystagmus

*Horizontal Gaze Nystagmus*

Is defined as:
- The involuntary jerking of the eyes as they gaze toward the side.

Although this type of nystagmus is useful in determining alcohol influence, its presence may also indicate use of Dissociative Anesthetics, Inhalants, and other CNS Depressants.

*Vertical Gaze Nystagmus*

Is defined as:
- The involuntary jerking of the eyes (up and down), which occurs when the eyes gaze upward at maximum elevation.

As defined in the current revision of the SFST curriculum.

These are known as DID drugs.

The presence of this type of nystagmus is associated with a high dose of a CNS Depressant (including alcohol), an Inhalant, or a DA for a particular subject.
VGN will not be present without HGN.

If VGN is present and HGN is not, it could indicate a medical condition.

Resting Nystagmus

Is defined as:

The involuntary jerking of the eyes as they gaze straight ahead.

This condition is not frequently observed. Its presence may indicate Dissociative Anesthetic usage, high levels of an impairing substance for that individual or some other medical problem.

If detected, take precautions. As always, exercise sound officer safety techniques and consider calling for medical aid.

III. HORIZONTAL GAZE NYSTAGMUS

HGN becomes observable when a subject is:

- Impaired by alcohol
- As the subject’s BAC increases.
• Jerking will appear sooner.

HGN is also visible:

• When an individual is impaired by DID.

In administering the HGN test:

• Subject must focus on stimulus

This stimulus can be:

• Tip of a pen
• Or similar object
• Contrasts with background.

A. Initiating the HGN Test

Subject should:

• Be turned away from emergency lights
• Take care as to not interfere with subject’s ability to focus on stimulus

Ask class to give examples of a good stimulus.

Make sure you remind the officer to follow their local policy or recommendations when selecting a stimulus.
The instructor should give examples of why this situation would occur.

The ultimate reason for repositioning the suspect is for officer safety, second is to obtain the best possible position to observe the HGN Clues.

- The individual should not be wearing glasses.

Give the subject the following verbal instructions:

1. “I am going to check your eyes.”

2. “Keep your head still and follow the stimulus with your eyes only.”

3. “Keep your eyes on the stimulus until I tell you to stop.”

4. Position the stimulus approximately 12 to 15 inches from the face in front of the suspect’s nose and hold it slightly above eye level.
Check both eyes for equal pupil size and resting nystagmus.

- Both pupils should be of equal size and there should not be any noticeable nystagmus.

- If the pupils are noticeably unequal in size or there is noticeable nystagmus at rest. This could indicate a medical condition or a head injury.

Check both eyes for equal tracking

- This is done by making a rapid horizontal pass across both eyes.

- The movement should go from center, across the left eye, across the face to the person’s right eye, and back to center (total time approximately 2 seconds).

- Both eyes should track the stimulus together.

- If the eyes fail to track together, discontinue the test. This could be the indication of a possible medical disorder, injury or blindness.

B. Administration of the HGN.

1. Lack of smooth pursuit
- When the eyes jerk or bounce as they follow a smoothly moving stimulus.

- Check the subject’s left eye first.

- Move the stimulus smoothly, at a speed that requires about two seconds to bring the subject’s eye as far to the side as it can go.

- Carefully watch the subject’s left eye and determine if it is able to pursue smoothly.

- Move the stimulus all the way to the left, back across the subject’s face and check the right eye at the same speed.

- Movement of the stimulus should take approximately two seconds to move from the center of the subject’s face to the shoulder on the left side.

- Approximately two seconds to get back to the center then.

- Approximately two seconds to move from the center of the subject’s face to the shoulder on the right side.
Then approximately two seconds to return to the center of the subject’s face to end the first pass.

Repeat the procedure until each eye has been checked twice.

The stimulus should be moved in a smooth manner to best observe the eyes in motion.

The two-second timing is provided based on how the eye should follow the stimulus if the individual is not impaired by alcohol and/or other drugs.

- Reference PowerPoint graphic illustration

- Reference PowerPoint video demonstration

2. Distinct and Sustained Nystagmus at Maximum Deviation

At extreme lateral gaze, also known as the endpoint or maximum deviation, the nystagmus is obvious and sustained when the stimulus is held for a minimum of 4 seconds.

- Start again with the individual’s left eye.
<table>

</tbody>
</table>

3. Onset of Nystagmus prior to 45 degrees.

• Start again with the individual's left eye

• Move the stimulus at a speed that would take at least four seconds to reach the 45 degree angle.
• Watch the eye carefully for any sign of jerking.

• If jerking is observed, hold the stimulus at that position and verify the nystagmus is distinct and sustained.

• Move the stimulus all the way to the left, back across the individual’s face and check the right eye.

• Repeat the procedure until each eye has been checked twice.

• Reference PowerPoint video demonstration

• Onset of nystagmus prior to 45 degrees

• 45 Degree Template

• HGN Test Criterion

4. Vertical Nystagmus

• Start with the stimulus approximately 12-15 inches from the face in front of the nose.

• Elevate the stimulus up until the eyes can not elevate further.

• Hold the stimulus in that position for a minimum 4 seconds, but no longer than 30 seconds.
### **AIDS LESSON PLAN**

|  | • If vertical nystagmus is present it must be distinct and sustained.  
   • Reference PowerPoint video demonstration  

**PRACTICAL EXERCISE**

*The scoring handout should be disseminated at his time. Located in the Administrative Guide.*

5. Test Interpretation

There are:

- Three clues in each eye.
- Six total clues.

1) Lack of Smooth Pursuit.

- Present
- Not Present.
- If present, it accounts for 2 clues, one in each eye.

2) Distinct and sustained Nystagmus at Maximum Deviation.

- At this point the instructor should have the Dry Lab workshop tapes Cued to the beginning of tests for one subject. This subject should be used to demonstrate the tests throughout this section.

- It is important to hold the eye in this position for at minimum of four (4) seconds.
3) Onset of Nystagmus Prior to 45 Degrees.
   The more impaired a person becomes the sooner the onset of nystagmus is observed.

6. Documenting the HGN Clues

   The HGN test has been researched and found to be a reliable indicator of impairment with subjects at or above 0.08 BAC.

   If two or three clues are observed, it is likely that the subject's BAC is at or above 0.04 but under 0.08.

   When applicable you should always document the clues of impairment as you are conducting the roadside tests.

   Make sure that you keep officer safety in mind when documenting these clues.

   Each jurisdiction has come up with techniques and forms to record the results. As long as these forms follow the NHTSA/IACP manuals, they may be used. Listed in your manual is only one example that could be used.
IV. WALK AND TURN TEST

The Walk-and-Turn (WAT) test is divided into two stages:

1. Instruction Stage
   2. Walking Stage.

Instruction Stage

1. Stand heel-to-toe with arms at their sides.

2. Divided attention, listening to and remembering instructions.

Walking Stage

1. Balancing, walking heel-to-toe, and turning,

2. Small muscle control, counting out loud, and short-term memory, recalling the number of steps required, turning as instructed, and counting correctly.

1. Officer safety precautions
   a. Keep suspect on your left during demonstration
   b. Never turn your back on a suspect
   c. Be aware of surroundings

the time of observation through the post arrest processing.
### Instruction Stage:

1. “Place your left foot on the line” (real or imaginary).

2. “Place your right foot on the line ahead of the left foot, with heel of right foot against toe of left foot”.

3. "Place your arms down at your sides".

4. "Maintain this position until I have completed the instructions. Do not start to walk until told to do so."

5. "Do you understand the instructions so far?"

### Walking Stage

1. "When I tell you to start, take nine heel-to-toe steps, turn, and take nine heel-to-toe steps back."

2. "When you turn, keep the front foot on the line, and turn by taking a series of small steps with the other foot, like this."

3. "While you are walking, keep your arms at your sides, watch your feet at all times, and count your steps out loud."
4. "Once you start walking, don't stop until you have completed the test."

5. "Do you understand the instructions?" (Make sure the individual understands.)

2. Test Evaluation

Look for the following clues each time the Walk-and-Turn test is administered.

1. Cannot keep balance while listening to the instructions.
   - Record this clue if the individual does not maintain the heel-to-toe position throughout the instructions.
   - Do not record this clue if the suspect sways or uses the arms to balance but maintains the heel-to-toe position.

2. Starts before the instructions are finished.
   - Since you specifically instructed the suspect not to start walking "until I tell you to begin," record this clue if the individual does not wait.

Make sure subject verbally acknowledges understanding.

Feet must actually break apart.
3. Stops while walking.
   - The individual pauses for several seconds. Do not record this clue if the individual is merely walking slowly.

4. Does not touch heel-to-toe. The individual leaves a space of more than one-half inch between the heel and toe on any step.

5. Steps off the line. The individual steps so that one foot is entirely off the line.

6. Uses arms to balance. The individual raises one or both arms more than 6 inches from the sides in order to maintain balance.

7. Improper turn. The individual removes the front foot from the line while turning. Also record this clue if the individual has not followed directions as demonstrated, i.e., spins or pivots around.

8. Incorrect number of steps. Record if the individual takes more or fewer than nine steps in either direction.

If a subject is unable to complete the test he/she will be held accountable for only the clues that were demonstrated. We no longer assess all eight clues for these subjects.
3. Documenting the Walk and Turn Clues

Each clue is noted by placing a slash in the appropriate place on the assessment form.
For example:

1. If the individual raised their arms twice and stepped off the line three times, they would be considered to have demonstrated “two” clues.

It is a good practice to use an assessment form that documents the administrative procedures.

4. Considerations

Walk-and-Turn test requires a designated straight line, and should be conducted on a reasonably dry, hard, level, non-slippery surface.

There should be sufficient room for individuals to complete nine heel-to-toe steps.

However, recent field validation studies have indicated that varying environmental conditions have not affected a subject’s ability to perform this test.

The original research indicated that subjects over 65 years of age had difficulty performing this test.
Individuals wearing heels more than 2 inches high should be given the opportunity to remove their shoes.

**PRACTICAL EXERCISE**

*The scoring handout should be disseminated at his time. Located in the Administrative Guide.*

At this point the instructor should have the Dry Lab workshop tapes Cued to the beginning of tests for one subject. This subject should be used to demonstrate the tests throughout this section.

Show only the Walk and Turn Session of the video. Stop the tape when the WAT is complete.

- Walk-and-Turn Test Criterion
  - 2 or more clues indicates a BAC at or above 0.10 – 68% accuracy (1977 Study)
V. ONE-LEG STAND

The One-Leg Stand (OLS) test is divided into two stages:

1. Instruction stage
2. Balancing and counting

Instruction Stage:

1. Balancing
2. Listening to instructions

The Balancing Stage:

1. Balancing
2. Short-term memory

1. Administrative Procedures

2. Initial Positioning and Verbal Instructions

3. “Stand with your feet together and your arms down at your sides.”

4. “Remain in this position and do not begin until I tell you to do so.”

5. “Do you understand the instructions so far?”

3. Instructions for the Balancing and Counting Stage

Make sure subject verbally acknowledges understanding.
1. "When I tell you to start, raise one leg, either leg, approximately six inches off the ground, keep your raised foot parallel to the ground."

2. “Keep both legs straight, arms at your side.”

3. “While holding that position, count out loud in the following manner: “one thousand one, one thousand two, one thousand three, and so on until told to stop.”

4. “While performing this test, keep your arms at your sides at all times and keep watching the raised foot.”

5. “Do you understand?”

6. “Go ahead and begin the test.”

If the subject puts their foot down, instruct the subject to pick the foot up again and continue counting from the point at which the foot touched the ground.
If the subject counts very slowly, terminate the test after 30 seconds.

If the subject counts quickly, have them continue counting until told to stop.

4. Test Evaluation

Look for the following clues each time the One-Leg Stand test is administered:

1. Puts foot down.

2. Uses arms for balance.

3. Sways while balancing.

4. Hopping

**Documentation**

Each clue is noted by placing a slash in the appropriate place on the assessment form.

For example, if the individual used their arms twice and swayed three times, they would be considered to have demonstrated “two” clues. It is a good practice to use an assessment form that documents the administrative procedures.
### Considerations

Some people may have difficulty with the one leg stand test even when not impaired. Persons with injuries to their legs and/or hips or inner ear disorders may have difficulty with this test.

Individuals wearing shoes more than 2 inches high should be given the opportunity to remove them.

- **One-Leg Stand test criterion**
  
  2 or more clues indicates a BAC at or above 0.10 – 65% accuracy (Burns, 1977)

**PRACTICAL EXERCISE**

*The scoring handout should be disseminated at his time. Located in the Administrative Guide.*

At this point the instructor should have the Dry Lab workshop tapes Cued to the beginning of tests for one subject. This subject should be used to demonstrate the tests throughout this section.
SESSION III
SFST PARTICIPANT PROFICIENCY EXAMINATION
Session III  SFST Proficiency Examination

Upon successfully completing this session, the participant will be able to:

1. Demonstrate knowledge and proficiency in administering the Standardized Field Sobriety Test Battery.

Note: The participant must successfully pass the NHTSA/IACP Proficiency Examination to continue in the Advanced Roadside Impaired Driving Enforcement Program Training.

<table>

## I. STANDARDIZED FIELD SOBRIETY TEST BATTERY

A. Upon Successful completion of this session the participant will be better able to:

1. Demonstrate knowledge and proficiency in administering the SFST battery.

## II. Explanation for Proficiency

SFST is the foundation of every impaired driving training program that has been developed, researched, and supported for over two decades. Specifically, the ARIDE and DEC programs

This makes it very important for the participants to be proficient in administrating these tests.

NHTSA, IACP, and the courts have recognized the importance of proficiency as it relates to the detection, arrest, and prosecution of impaired drivers.

By recognizing this, NHTSA is committed to bridging the information gaps between the governing bodies and the agencies applying these techniques in the field.

There are several factors that can affect a law enforcement officer’s SFST proficiency.
They include the following:

1. Adult learning limitations
2. Officer assignment
3. Time to practice proficiency
4. Opportunity to use in the field
5. Limitations of instructors
6. Gaps in communication
7. Program administration

III. SFST Proficiency Examination

The participant must be able to demonstrate their ability to administer the SFST battery without the aid of any reference materials and from memory.

DO NOT offer this aid, however keep in mind many law enforcement officers carry pocket instructions on duty. If they approach you then they should be allowed to use them.

If this, is the case they will be allowed to use them during the proficiency examination.

The participant will be given only two opportunities to successfully demonstrate the proper administration of the SFST battery.

If the participant fails their first attempt,

- They will be given the opportunity to practice on their own or with another participant within a reasonable amount of time not to exceed the end of the first day.
<table>

</table>
| • The instructor will not assist or coach the participant in any manner during the proficiency examination.  
• The instructor will correct the participant after the completion of all three tests, but will not correct the participant during the tests.  
• A “check” will be placed in the space provided for each step completed correctly.  
• An “X” will be placed in the space if the participant does not perform the step according to the current standards as set for SFST.  

Remember the Instructors are here to assist you with the proficiency.  

If the participant is having trouble passing the proficiency examination the participant shall be responsible for seeking out instructors to assist them.  

*If the participant does not pass the second proficiency examination they will not be allowed to continue in the training.*
SESSION IV

DRUGS IN THE HUMAN BODY
Session IV    Drugs in the Human Body

Upon successfully completing this session, the student will be able to:

1. Describe, in general terms, the basic purpose and functions of selected major systems in the human body as they relate to observable signs.

2. Identify methods of ingestion and general effects of drugs.

3. Identify medical conditions which may mimic alcohol and drug impairment.

4. Identify the seven major drug categories as referenced in the DECP and the basis for dividing drugs into these specific groups.

I. DRUGS IN THE HUMAN BODY

A. Upon successfully completing this session, the student will be able to:

1. Describe, in general terms, the basic purpose and functions of selected major systems in the human body as they relate to observable signs.

2. Identify methods of ingestion and general effects of drugs.

3. Identify medical conditions which may mimic alcohol and drug impairment.

4. Identify the seven major drug categories as referenced in the DEC and the basis for dividing drugs into these specific groups.

This process is dependent, in part, on:

- Recognizing changes in behavior
- Observable signs and symptoms related to an impaired individual.

In order to gain a better understanding of how alcohol and/or drugs affect bodily functions, it is helpful to be familiar with the processes of the human body.
This section is designed to provide the participant with:

- General overview related to how drugs affect the body in basic terms.

- Highlight those systems involved with distribution, absorption, metabolism, and elimination of alcohol and/or other drugs in the body.

- Pharmacokinetics

In simple terms, Pharmacokinetics accounts for how a chemical substance is transported through the body in terms of absorption, distribution, metabolism, and elimination.

- Explain the different types of drug ingestion.

- Describe medical conditions, which may mimic the signs and symptoms of alcohol and/or drug use.

- Identify the seven drug categories used by the DEC program.

- Introduction of a drug indicator matrix

II. DRUG

As we progress through this course, it is important to understand how drugs are defined.
The following provides operational definitions for drug and psychoactive which describe the majority of the drugs we will discuss as part of this course.

1. Drug

A drug is:

Any substance which, when taken into the human body, can impair the ability of the person to operate a vehicle safely.

2. Psychoactive

A psychoactive drug or substance:

Is a chemical that alters brain/body function, resulting in temporary changes in perception, mood, consciousness, or behavior.

Such drugs are often used for:

- Recreational
- Spiritual purposes
- Medical, especially for treating neurological
- Psychological illnesses and deficiencies

### III. Introduction of Selected Systems of the Human Body

A. There are ten systems in the human body:

1. Muscular
2. Urinary  
3. Respiratory  
4. Digestive  
5. Endocrine  
6. Reproductive  
7. Skeletal  
8. Integumentary (skin)  
9. Nervous  
10. Circulatory  

In order to illustrate the impact of drugs, alcohol or a combination of substances, it is helpful to think of it in terms of:

- Ingestion  
- Onset  
- Duration of effects  
- Elimination  

The systems we previously discussed provide the most predominant observable signs and symptoms related to influence of alcohol and/or other drugs on human body.

**B. Digestive System**

- Stomach  
- Pyloric Valve  
- Intestines (Large and Small)  
- Liver / Pancreas  

This system breaks down food and/or chemicals, metabolizes and eliminates waste products.

How does the body break down chemicals, such as alcohol to its basic elements for elimination?

Example: Oxygen dehydrogenase breaks down alcohol into carbon dioxide and water.
C. Urinary System

The urinary system is responsible for the elimination of waste from the body.

It consists of:

- Two kidneys connected by long tubes (urethras) to the bladder, which stores urine.
- A third tube, the urethra, carries the urine from the bladder out of the body.
- Kidneys - filters waste products out of the system as blood passes through them.

Since drugs are removed from the blood in the kidneys and passed out of the body in the urine, the urinary system plays a key role in producing evidence of drug use.

D. Respiratory System

The primary organs of the respiratory system are:

- Diaphragm
- Lungs

What types of signs, related to the respiratory system, could an individual display while under the influence of alcohol and/or drugs?

Examples: Rapid or shallow breathing
The diaphragm is a muscular sheet that separates the thoracic (upper) cavity from the abdominal (lower) cavity, and draws fresh air into the lungs and forces used air out.

The transfer of oxygen from the air to the blood and Carbon dioxide from the blood to the atmosphere occurs in the lungs.

Oxygen must be supplied to all the body cells, and carbon dioxide must be removed from them in order for life to exist.

E. Muscular System

The body has three types of muscles:

1. Heart
2. Smooth muscles (which control involuntary movements)
3. Striated muscles (which control voluntary movements).

The brain controls the operation of all these muscles through the nervous system.

What types of signs, related to the muscular system, could an individual display while under the influence of alcohol and/or drugs?

Examples: Body or leg tremors, gait ataxia, lack of muscle control & lack of coordination.
The impact of drugs and alcohol on the muscular system can often be observed during the walk-and-turn, one-leg stand test, as well as during general observations.

F. Circulatory System

The circulatory system consists of

- Heart
- Blood vessels
- Blood

The heart pumps blood throughout the body transporting

- Food,
- Water,
- Hormones,
- Antibodies,
- Oxygen,
- Carbon dioxide
- Other substances to and from the body cells as required.

Body temperature regulation is a partial responsibility of the circulatory system, since warm blood is constantly moved throughout the body.

The circulatory system plays a key role in transporting drugs to the brain, where most of the drugs' effects are exerted.
The circulatory system also transports the drugs to the liver and other organs, where the drugs are metabolized.

G. Nervous System

The nervous system serves as the control center for the human body.

It consists of:

- Brain
- Spinal cord
- Nerves

Each of these components is made up of nerve cells (neurons) and supporting tissues.

The nervous system keeps the body apprised of changes in the environment by enabling:

- Sight
- Hearing
- Smell
- Taste
- Touch

Through sensations of temperature, pressure, pleasure and pain.

The nervous system also enables reasoning, memory and emotions.

The central nervous system sends impulses that cause muscles to contract and
glands to secrete, and it works with all body systems to integrate all physiological processes so that normal functions can be maintained.

Much of the activity of the nervous system is involuntary and therefore it is carried out below the level of consciousness.

The Central Nervous System (CNS) is one of the body’s major control systems and the brain is the center of that system.

The brain is made up of billions of nerve cells, also known as neurons.

Nerve cells communicate by transferring chemical substances between each other.

When a message is sent from one neuron (transmitter), it triggers the release of neurotransmitters and sends the message to another nerve cell which is called the receptor.

This is the way nerve cells share information.

There are many different types of neurotransmitters and each one has a specific role to play in how the brain and the CNS functions.
Some drugs affect the brain because their chemical makeup is similar to the neurotransmitters which occur in the body naturally.

In the appropriate dose amount, drugs have a positive influence on how the neurons function.

However in some cases, drugs can cause the release of large amounts of a similar neurotransmitter while others can block the receptors.

All drugs of abuse, such as nicotine, cocaine, and marijuana, impacts the limbic system of the brain.

The limbic system generates:

- Our feelings
- Emotions
- Motivations
- Supports memory and learning.

It responds to pleasurable experiences by releasing the neurotransmitter dopamine.

The effect which a subject experiences when dopamine is ‘dumped’ in the CNS, creates a euphoric sensation which makes some drugs of abuse so appealing to the user.
The actions associated with the communication between neurons affects the other systems of the human body.

IV. Homeostasis

Homeostasis is:

any self-regulating process by which a biological or mechanical system maintains stability while adjusting to changing conditions.

As we have discussed earlier in this section, the human body is made up of systems.

They are in a dynamic equilibrium.

Under normal circumstances, systems seek a balance in which internal change continuously compensates for external change in a feedback control process to keep conditions relatively level.

A. Examples of Homeostasis

1. Temperature regulation

- Mechanically in a room by a thermostat
- Biologically in the body by a complex system controlled by the hypothalamus in the brain.
Every organ system plays some role in the maintenance of homeostasis.

1. The circulatory system keeps the body sufficiently supplied with fluids.

2. The respiratory system constantly brings in oxygen and eliminates carbon dioxide;

3. The digestive and urinary systems take in food and water and eliminates waste.

4. The nervous system integrates the functioning of the other systems; and so on.

When alcohol and/or other drugs are introduced into the body, the resulting interactions can cause the body to:

- Speed up
- Slow down
- Become confused

The observation and examination of selected bodily functions help to indicate whether a subject is impaired by alcohol and/or other drugs.

V. Methods of Ingestion and General Effects of Drugs

In general terms

Ingestion is:
• The act of taking food or another substance into the body through the mouth.

For the purpose of this course:

• We will use the term ingestion to describe any manner by which a drug or alcohol enters the human body whether it be orally or otherwise administered.

1. Injection

• Is a common method of administering heroin (narcotic analgesic),

• Is also used to introduce stimulants, hallucinogens, disassociative anesthetics, and other narcotic analgesics into the body.

• CNS depressants can also be injected but this is not common due to the size of the needle required to deliver the substance.

In addition to injecting drugs into the veins in the arms, users will find more creative and less conspicuous areas on the body to administer a substance since needles typically leave marks which can be difficult to disguise.
2. Insufflation

- The act of introducing a substance directly into the respiratory system by inhaling through the nose for the purpose of intranasal absorption through the mucous membrane.

For a substance to be effective when insufflated it must be in a water soluble powder so it can be readily absorbed through the mucous membranes.

- This method is commonly referred to as snorting.

1) Categories which are commonly introduced to the body through insufflation are:

   - Stimulants
   - Hallucinogens
   - Dissociative Anesthetic
   - Narcotic Analgesics
   - Inhalants

3. Inhalation

- The act of introducing a substance directly into the respiratory system through the nose and mouth for the purpose of absorbing the substance through the alveoli in the lungs.
• This is a very rapid method of absorption and is often referred to as huffing, sniffing, or smoking.

1). Categories which are commonly introduced to the body through inhalation are:

• Cannabis
• Narcotic Analgesics
• Dissociative Anesthetic
• Hallucinogens
• Stimulants

4. Transdermal

• A less common method of administering drugs.

Transdermal means that the chemical or drug is absorbed into an individual’s system through the skin.

Drugs which are able to be administered transdermally can be administered accidentally through contact.

Some selected hallucinogens, dissociative anesthetics, and narcotic analgesics can be administered transdermally.

An example of a drug prescribed to be transmitted through the skin is the birth control patch and nicotine patch.

Point out to the participants the importance of officer safety indicated in their manual.

Example: Wear protective glasses, masks, and gloves when searching subjects and vehicles.
### VI. Medical Conditions Which May Mimic Drug Impairment

There are medical conditions and injuries that may cause individuals to appear to be impaired by alcohol and/or other drugs.

Some of the more common medical conditions are listed and discussed below:

1. **Head Trauma**

   A severe blow or bump to the head may injure the brain and create
   - Disorientation,
   - Confusion
   - Lack of coordination
   - Slowed responses
   - Speech impairment
   - Other gross indicators of alcohol or drug influence

   Because the injury usually affects one side of the brain more than the other, disparities usually will be evident in the subject's eyes.

   Sometimes the pupils will be noticeably different in size or one eyelid may droop while the other appears normal.

   Additionally, the eyes may not be able to track equally while focusing on a stimulus.
2. Stroke

A stroke will usually produce many of the same effects and indicators associated with head trauma.

Stroke victims often will have:

- Pupils that are noticeably different in size. One pupil may remain fixed and exhibit no visible reaction to light, while the other reacts normally.

- Paralysis, physical weakness and other observable signs are often more predominate on one side of the body than the other.

- Additionally, individuals suffering from a stroke will often have a dazed appearance and be confused and/or scared.

3. Diabetes

A diabetic is most likely to be confused with a person impaired by alcohol and/or drugs when they have too much insulin, causing the blood sugar level to become dangerously low.

This condition is referred to as insulin shock.
A diabetic in insulin shock:

- May appear very confused
- May be non-responsive
- Sweat profusely
- Exhibit elevated pulse rate
- Elevated blood pressure

4. Conjunctivitis

This is an inflammation of the mucous membrane that lines the inner surface of the eyelids giving a red bloodshot appearance to the conjunctiva of the eyes.

At first glance, this may appear similar to the bloodshot conditions associated with impairment by alcohol or cannabis.

This condition may occur in one or both eye and is often referred to as ‘pink eye’.

5. Shock

Shock is a life-threatening condition that occurs when the body is not getting enough blood flow.

This can damage multiple organs and lead to death.

Shock requires IMMEDIATE medical treatment and can get worse very rapidly.
Individuals in shock often will appear dazed, uncoordinated, and non-responsive.

6. Multiple Sclerosis

Victims of Multiple Sclerosis (MS) and other degenerative muscular disorders may lack coordination or exhibit gait ataxia, tremors, slurred or garbled speech, and many of the other gross motor indicators of intoxication.

Unlike subjects impaired by alcohol and/or drugs, MS suffers usually appear alert.

7. Other Medical Conditions

Some other medical conditions that may cause signs and symptoms similar to drug impairment include:

- Carbon monoxide poisoning
- Seizures
- Endocrine disorders
- Neurological conditions
- Psychiatric conditions
- Infections

8. Behavioral Conditions

There are some behavioral conditions that may affect vital signs:

- Exercise
- Excitement
- Fear
VII. **Introduction to the Seven Drug Categories**

As a review, the definition of a drug, adopted by the DEC program and this course:

*Any substance which, when taken into the human body, can impair the ability of the person to operate a vehicle safely.*

Based on this definition of drug, the DEC program divided drugs into seven broad categories.

These drug categories are based on the observable signs and symptoms they produce.

The following is a brief description of each category:

1. **Central Nervous System Depressants**

   - Includes a large number of different drugs. The common drug in this category is alcohol. CNS depressants slow down the operation of the brain and other parts of the central nervous system.

• Anxiety
• Depression
2. Central Nervous System Stimulants

- Influence the human body by speeding up, or over stimulating the brain. Cocaine is an example of a CNS stimulant.

3. Hallucinogen

- Includes some natural, organic substances as well as some synthetic chemicals. All hallucinogens impair the subjects ability to perceive reality. LSD is an example of a hallucinogen.

4. Dissociative Anesthetic

- Consists of the drug DXM, PCP and its various analogs. DA is a powerful drug that acts like a depressant in some ways, but also causes the body to respond similar to a stimulant as well as a hallucinogen.

5. Narcotic Analgesics

- Relieves pain, produces addiction, and withdrawal symptoms. Heroin is an example of a narcotic analgesic.
6. Inhalants
   - Are breathable chemicals, which are contained in familiar household items that can be easily purchased. Paint is an example of an inhalant.

7. Cannabis
   - The most popular widely used and abused illegal drug and is most commonly referred to as marijuana.
SESSION V

OBSERVATION OF THE EYES AND OTHER INDICATORS OF DRUG IMPAIRMENT
SESSION V Observation of the Eyes and Other Indicators of Drug Impairment

Upon successfully completing this session, the student will be able to:

1. Discuss Vertical Gaze Nystagmus: How to administer properly and describe what the results indicate.

2. Discuss Lack of Convergence: How to administer properly and describe what the results indicate.

3. Describe the difference in pupil size.

4. Discuss modified Romberg Balance Test: How to administer properly and describe what the results indicate.

5. Explain the relationship between eye examinations and the seven categories

I. Observations of the Eyes & Other Indicators of Drug Impairment

A. Upon successful completion of this session, the student will be better able to:

1. Discuss Vertical Gaze Nystagmus

2. How to administer properly and describe what the results indicate

3. Discuss Lack of Convergence.

4. How to administer properly and describe what the results indicate

5. Describe the difference in pupil size

6. Discuss Modified Romberg Balance Test.

7. How to administer properly and describe what the results indicate.

8. Explain the relationship between eye examinations and the seven categories
I. Administration and Interpretation of Additional Roadside Sobriety Tests

A. This section describes the administration and proper interpretation of the following tests:

- Pupil size observations
- Lack of convergence (LOC)
- Modified Romberg Balance test

II. Pupil Size Observation

1. The pupil is basically a circular hole in the middle of the iris, which regulates the amount of light that passes through into the retina.

2. The pupils of the eyes continually adjust in size to accommodate different lighting conditions and refocus according to focal length.

3. When placed in a darkened environment, the pupils will normally expand in size, or dilate, to allow the eyes to capture as much light as possible.

4. When the lighting conditions are very bright, the pupils will normally shrink or constrict, to limit the amount of light that passes through and to keep the eyes from being over stimulated.
5. This process of constriction and dilation normally occurs within certain limits.

6. This course trains officers to recognize the noticeable differences in the pupils.

Example: If a stop is made during the day, you should expect to see the pupils somewhat smaller, because of the bright lighting conditions.

7. When ingested, each of the seven drug categories has a predictable effect, with some exceptions, on the pupils of the eyes, which will be discussed in the subsequent sections.

Note: If you make a stop at night and the pupils are somewhat constricted, then there may be a drug causing the pupil reaction.

(Narcotic)

Dilated Pupils:

- The pupils appear larger than normal for the given lighting condition, resulting in a noticeably larger opening (circle) in the center of the eye.
Constricted Pupils:

- When pupils appear smaller than normal for the given lighting conditions, resulting in a noticeably smaller opening in the center of the eye.

The effects that drugs have on the eyes are involuntary reactions, which mean they cannot be controlled by the individual.

A. Conduct practical exercise

Line students up along a wall, have each individual student walk down the line observing the pupils of each individual.
IV. Lack of Convergence

A. Definition of LOC

The inability of a subject to cross their eyes when focusing on a stimulus as it is moved towards the bridge of their nose.

B. Administration of LOC

Instructional Stage

1. Inform the suspect that you will be moving the stimulus around in a circle, and will be moving it toward the bridge of their nose. In addition, inform the suspect that you will not actually touch the nose with the stimulus. This notice is important so the individual will not move their head away.

2. Instruct the suspect to keep their head steady and to follow the stimulus with their eyes only.

3. Position the stimulus approximately 12-15 inches in front of the subject’s nose in the same position as used in the HGN test.
Testing Stage

1. Start moving the stimulus and make two circles in front of the subject’s face, either in a clockwise or counterclockwise motion. Observe the eyes to verify the subject is tracking the stimulus.

2. Slowly move the stimulus in toward the bridge of the subject’s nose stopping approximately 2” from the bridge of the nose.

3. Hold the stimulus 2” from the bridge of the subject’s nose for approximately one (1) second and then remove it, while continuing to observe the subject’s eyes.

4. Law enforcement officers should not touch the bridge of the nose with the stimulus.

C. Test Interpretation

The subject’s eyes should come together and cross (converge) as they track and remained aligned with the stimulus.
• If the eyes are able to cross (converge), i.e., if they both come together when the stimulus is stopped approximately 2” from the bridge of the subject’s nose, lack of convergence is “not present.”

• If one eye drifts away or outward toward the side instead of converging toward the bridge of the nose, lack of convergence is “present”.

Drug Categories that induce LOC
- CNS Depressants
- Inhalants
- Dissociative Anesthetics
- Cannabis

Left Eye Unable to Converge

Both eyes began to converge, however the left eye bounced down and back out

Both eyes unable to converge

Both eyes began to converge, however they both stopped before the convergence was completed.
There are no validated clues associated with the LOC test, the officer should note all observations associated with this test.

The law enforcement officer should note whether or not convergence is present and document their observations as to the movement of the eyes during this test.

D. Conduct Practical Exercise

Split class into groups of three and have them practice administering LOC

**Conduct PowerPoint exercise after the practical exercise is complete**

V. Modified Romberg balance test

A. The Modified Romberg Balance test is adapted from its original use as a neurological assessment tool in order to check a subject’s internal clock, balance, and presence of tremors (eye and body).

Since part of the Modified Romberg Balance test checks for balance, care should be taken to ensure the test is conducted on a level surface and in an environment, which is

**Note:** The participant should draw a picture of what the eyes did during the administration of LOC.

**Note:** Eyelid and body tremors

**Note:** DO NOT tell the subject to "count to thirty"

**SIMPLY State,** "keep your head tilted back with your eyes closed until you think that thirty seconds have gone by".
appropriate for this type of test when conducted at roadside.

The Modified Romberg Balance test is divided into three parts which are conducted simultaneously.

1. Estimate the passage of 30 seconds
2. Observation of tremors
3. Observation of sway

There are two stages to the Modified Romberg Balance.

1. Instruction stage
2. Balancing stage

B. Administrative Procedures

Instruction Stage

1. Instruct the subject to stand straight with their feet together and their arms down at their sides.

2. Tell the subject to remain in that position until you have finished giving the instructions.

Emphasize that they must not start the test until you say, “begin".
<table>

</thead>
<tbody>
<tr>
<td></td>
<td>3. Ask the subject if they understand the instructions so far.</td>
<td>Note: Make sure to obtain a verbal response from the subject.</td>
</tr>
<tr>
<td></td>
<td>4. Tell the subject, “When I tell you to” tilt your head back slightly and close your eyes.</td>
<td>Note: Demonstrate this without closing your eyes.</td>
</tr>
<tr>
<td></td>
<td>5. Estimate the passage of 30 seconds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>6. Tell the subject that, when they think the 30 seconds has gone by, bring you head forward, open your eyes, and say &quot;Stop&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>7. Ask the subject if they understand.</td>
<td>Note: Make sure to obtain a verbal response from the subject.</td>
</tr>
</tbody>
</table>

Balancing Stage

1. Instruct the subject to tilt their head back and close their eyes.
2. Look at your watch and pick a convenient time to start the test.
3. Tell the subject to begin
4. Keep track of time while the subject performs the test.
5. Check subject for presence of tremors (eyelid and/or body) and sway.

6. When the subject opens their eyes, ask them "How much time was that?"

Test interpretation and documentation

Note: Make sure to document their “exact” verbal response.

VI. Relationship Between the Eye Observations and the Drug Categories

A. Eye observations

Eye observations can provide valuable information, which can help determine impairment.

Additionally, we discussed in Session II that HGN is a critical part of assessing subjects suspected of being under the impaired by alcohol.
<table>
<thead>
<tr>
<th>AIDS LESSON PLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>HGN also plays a significant part in the evaluation of individuals who might be impaired by drugs alone or in combination with alcohol.</td>
</tr>
<tr>
<td>In addition to HGN, VGN, and LOC, pupil size can also provide information, which contributes to the overall process in determining whether or not an individual is impaired by alcohol and/or drugs.</td>
</tr>
<tr>
<td>We have included a chart to assist the law enforcement officer in recognizing signs of alcohol, drug, or a combination of both alcohol and drug impairment relative to eye observations.</td>
</tr>
<tr>
<td>This chart or any of the other information presented in this course relative to a specific drug category is not meant to encourage the officer to connect their observations to a specific drug category.</td>
</tr>
<tr>
<td>The law enforcement officer who successfully completes this course shall use only their roadside observations to make a decision as to whether the subject is impaired or not impaired according to their specific state’s statutes and support an arrest or no arrest decision.</td>
</tr>
</tbody>
</table>
Important Note: (Caution)

Although effects displayed in the table are what you will usually find when observing a subject impaired by various types of drugs, you may not always find them.

Not everyone is affected the same way by drugs. You need to remember this when describing drug effects. It is best “never to say never” and “always avoid saying always.”

The officer who completes this course is NOT certified as a DRE and does not have the training required to support the selection of a specific drug category, which may be the source of the subject’s impairment.
SESSION VI

SEVEN MAJOR DRUG CATEGORIES
SESSION VI  Seven Major Drug Categories

Upon successfully completing this session, the student will be able to:

1. Identify common drug names and terms associated with the Major Drug categories.

2. Identify the common methods of ingestion for each category.

3. Describe the general indicators of impairment associated with each category.

4. Describe conditions which may mimic the signs and symptoms associated with the each major drug category.

5. List the indicators which may emerge during the three phases of the DWI detection process (vehicle in motion, personal contact & pre-arrest screening) which may indicate the subject is under the influence of a drug(s).

## I. Central Nervous System Depressant

A. Upon successful completion of this session the participant will be better able to:

- Identify common drug names and terms associated with the Major Drug categories.
- Identify the common methods of ingestion for each category.
- Describe the general indicators of impairment associated with each category.
- Describe conditions which may mimic the signs and symptoms associated with each major drug category.
- List the indicators which may emerge during the three phases of the DWI detection process (vehicle in motion, personal contact & pre-arrest screening) which may indicate the subject is under the influence of a drug(s).

Historically, alcohol has been the most used and abused psychoactive depressant.

Ask class what the most used and abused drug is?
The majority of the general public is familiar with the effects of alcohol either through personal experience and/or observing others impaired by alcohol.

A. Identification of CNS Depressants

In order for a drug to be classified as a depressant according to the DEC program, it must:

1. Depress the activity of a subject’s brain and CNS.
   a. The depressant category initially affects a person’s functions:
      i. Speech
      ii. Coordination
      iii. Mobility

At doses greater than therapeutic levels, impairment of the body’s autonomic nervous system is affected.

The systems affected are:

- Heartbeat
- Body temperature
- Breathing
In addition to alcohol, the depressant category also includes:

- Antianxiety
- Antipsychotic
- Antidepressant
- Barbiturate
- Non-barbiturate or combination drugs

2. Subjects impaired by depressants may look very much like subjects impaired by alcohol, but without the odor of alcohol on their breath.

3. Most familiar and abused depressants are:

- Valium
- Prozac
- Xanax
- Soma

These are examples of just a few anti-anxiety tranquilizers, anti-depressants, and anti-psychotics legally prescribed for a variety of disorders.

There are also several illicit CNS depressants that have gained national attention in the past several years.
• Rohypnol (Roofies) (Flunitrazepam)

• Gamma Hydroxy Butyrate (GHB)

These drugs have been implicated in an alarming number of sexual assaults and overdose deaths.

Rohypnol is most commonly found in pill form (1 or 2 mg) and is still smuggled across the US/Mexico border.

B. Methods and Signs of Ingestion

Generally, CNS depressants will be found in pill or liquid form.

The most common method for using depressants is to take them orally.

Pills may be crushed and inhaled.

Some CNS depressants, on very rare occasions, may be injected.

When CNS depressants (other than alcohol) are taken orally, signs of ingestion may be difficult to detect.

• There are occasions when a subject may chew the tablets to create a quicker onset of effect.
When this happens traces of the tablet may be lodged in the teeth.

- Injection sites are easily identifiable by swelling of the area and ulcerations of the skin.
- The injection sites differ from those of other injectable drugs because liquid depressants are generally thicker and take a larger gauge needle to inject the drug.

C. Effects of CNS Depressants

A person impaired by a CNS depressant will look like a drunk, talk like a drunk, walk like a drunk, but they may not smell like a drunk.

Therapeutic doses (amounts typically prescribed by a physician) may not exhibit observable effects if they are ingested as prescribed.

Combinations of Depressants can be risky; they are commonly combined with Alcohol.

This increases the effects of the depressant and could magnify the effects and observable signs and symptoms.
D. General Indicators

- Wide variety of emotional effects:
  - euphoria
  - depression
  - laughing or crying for no apparent reason
- Reduced ability to divide attention
- Disoriented
- Sluggish
- Thick, slurred speech
- Drunk-like behavior
- Droopy eyes
- Fumbling
- Relaxed inhibitions
- Slowed reflexes
- Uncoordinated
- Drowsiness

How would a depressant possibly impair a subject’s ability to operate a vehicle safely.

Example: Slowed reflexes may cause a delay in applying brakes in a timely manner.
• Gait ataxia (rubber legged)

E. Eye Indicators

• HGN – Present
• VGN – May be Present – especially at high doses levels for that individual
• LOC – Present
• Pupil Size – Normal

F. Duration of Effects

There are four different categories of depressants which are classified based on their onset properties:

<table>
<thead>
<tr>
<th>Type</th>
<th>Onset</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long Acting</td>
<td>1 hr.</td>
<td>8 to 14 hrs</td>
</tr>
<tr>
<td>Intermediate</td>
<td>30 Min.</td>
<td>6 to 8 hrs</td>
</tr>
<tr>
<td>Short</td>
<td>10-15 min.</td>
<td>4 hrs or less</td>
</tr>
<tr>
<td>Ultra Short</td>
<td>Seconds</td>
<td>Very rapid</td>
</tr>
</tbody>
</table>

Duration of Effects

The duration of effects of CNS depressants can vary depending upon:

• Dosage amounts
• Age
• Weight
• Tolerance level
• Other variables may dictate the length of actual impairment.

### G. Overdose Signs and Symptoms

- Shallow breathing
- Cold/clammy skin
- Dilated pupils
- Rapid/weak pulse

### H. Medical Conditions that may Mimic Drug Impairment

- Extreme fatigue
- Very recent head injuries
- Diabetic reactions
- Hypotension (low blood pressure)
- Inner ear disorders
- Severe depression

### I. Examples of Drugs in the CNS Depressant Categories

A very sort list of examples is provided for the participants in the back of this session.

The list only covers the most common types of depressants that law enforcement officers may come in contact with.
The instructors may review them with the class, provided there is time to do so.

J. Complete Matrix Chart for CNS Depressant Category

I. CNS Stimulants

Central nervous system stimulants

- relieve fatigue
- aid in weight reduction
- reduce the need for sleep
- increase energy and confidence levels.

In general,

- it brings about both a psychological and physical exhilaration.

CNS stimulants are commonly known as:

- “uppers”

and their effects are similar to the body’s flight or fight responses.

As stimulants “wear off”, the individual can exhibit signs and symptoms similar to those associated with depressants since the some of the body’s systems may experience a “crash”.

Note: Refer to power point slides for examples of CNS Depressant drugs.
II. Identification of Stimulants

The most widely abused CNS stimulants are:

- cocaine
- amphetamines
- methamphetamines

Cocaine is made from the leaves of the coca plant and is generally found as a white or off-white power.

Crack cocaine is made by mixing

- baking soda,
- cocaine
- water
- then heating.

It appears as small white or off-white chunks.

Amphetamines are usually found in pill form and are legally manufactured for medical use.

Methamphetamine usually has the consistency of brown sugar, can be a variety of different colors, and is primarily produced illegally.

Ephedrine and pseudoephedrine are also classified as CNS stimulants.

Ephedrine is often advertised as diet supplements

- Diet Max
- Diet Now
<table>
<thead>
<tr>

</tr>
<tr>
<td>• “natural versions of illegal drugs” (Herbal Ecstasy and Herbal Bliss). Pseudoephedrine can be found in a variety of over-the-counter antihistamines, decongestants and cold products, thus making it more accessible.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Both are usually found in pill form and can be used in the production of methamphetamine.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• When taken in excess, they have the ability to impair.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Ritalin, Adderall, and Dexedrine are also classified as CNS stimulants.

These medications allow an individual with attention deficit disorder (ADD) and attention deficit hyperactivity disorder (ADHD) to focus their attention.

These medications have recently become common targets for abuse for students and professionals who want to obtain a temporary increase in their ability to focus and process information.
### III. Methods and Signs of Ingestion

A. There are many types of stimulants and their form will dictate the method of ingestion.

- Powder cocaine is typically inhaled, but can be injected or smoked.

- To be injected it must be converted to a liquid form. Users will heat the powder in distilled water. The chemicals will combine to form the injectable liquid.

- Crack cocaine is smoked. Crack Cocaine burns very hot, there may be signs of ingestion in the mouth

- Amphetamines are usually taken orally.

- Methamphetamine can be snorted, smoked, injected, or taken orally.

- Ephedrine, Pseudoephedrine, Ritalin (pill), Adderall (pill), and Dexedrine (pill and capsule) are primarily taken orally.

- Some schools have reported Ritalin to have been crushed and inhaled
by some abusers.

B. When a CNS stimulant is taken orally, signs of ingestion may be very limited.

When they are inhaled (as a powder) the nasal tissue may be irritated or inflamed.

When they are smoked, the intense heat of the smoke may cause the taste buds to rise, burn marks on the fingers (where the pipe was held), and burn marks on the lips (where the pipe touched the mouth).

Injection marks may be observed as a fresh puncture mark with blood oozing, bruising of the vein (caused by damage to the vein itself), or older marks, which may have dried blood covering the mark.

IV. Effects of CNS Stimulant

A. The main effect of most CNS stimulants is Euphoria – an extremely pleasurable sensation. This is only true while the high is felt.

You may find an opposite effect as the drug wears off.

While the drug is psychoactive, the person may seem like their system is speed up or in fast forward,
But!,

as the drug leaves the system (crashing), this person may appear as though they are under the influence of a CNS depressant.

### Slide 37

**B. General Indicators**

- Restlessness
- Body tremors
- Excited
- Euphoric
- Talkative
- Exaggerated reflexes
- Anxiety
- Grinding teeth (bruxism)
- Redness to nasal area
- Runny nose
- Loss of appetite
- Increased alertness
- Dry mouth
- Irritability

### Slide 38

**C. Eye Indicators / Matrix**

### Slide 39

**D. Duration of Effects**

**Cocaine:**
- 5 - 10 minutes (smoked)
- 45 - 90 minutes (injected)
- 30 - 90 Minutes (snorted)

**Amphetamines:** 4-8 hrs

**Methamphetamines:** 12 hrs

**Ritalin, Adderall, Dexedrine:** Various
## E. Overdose Signs & Symptoms

Overdose signs and symptoms of a CNS stimulant may include, but are not limited to:

- Possible increase in heart rate or intensity
- Convulsions
- Increased body temperature
- Hallucinations

## F. Conditions that may mimic CNS Stimulant drug impairment

There are several conditions that may mimic impairment by a CNS stimulant. These may be, but are not limited to:

- Hyperactivity
- Nervousness
- Stress
- Fear
- Hypertension (high blood pressure)

---

**Complete Matrix Chart for CNS Stimulant Category**
## I. Hallucinogens

Hallucination is a sensory experience of something that does not exist outside the mind.

### A. Hallucinogens affect a person’s

- Perceptions
- Sensations
- Thinking
- Self-awareness
- Emotional state

The category is classified in this manner because one of the significant effect of these drugs is hallucinations.

- This is called Synesthesia – or a transposition of senses.

### B. Identification of Hallucinogens

Some hallucinogenic drugs occur naturally.

- Peyote - is a species of cactus containing mescaline.
- There are numerous mushrooms (psilocybin) capable of inducing hallucinations.
• Jimson Weed and Morning Glory seeds can also be abused, often with tragic consequences.

• There is also a toad (Bufo Alvarius), which releases a hallucinogenic secretion when threatened.

Hallucinogenic drugs are also synthetically manufactured.

Some examples would be:

• Lysergic Acid Diethylamide (LSD) liquid can be placed on blotter paper and sold as tabs, or it can be absorbed by sugar cubes or other pills.

• Methylenedioxymethamphetamine (MDMA) or Ecstasy is an example of a synthetically produced hallucinogen. MDMA can be found as
  • a pill or as
  • a powder

A pill press can be used to compress the powder into a pill, which may contain a variety of different shape or figures.
The use and abuse of Ecstasy has received widespread attention because of its popularity in the “rave scene” and overdose deaths.

### C. Methods of ingestion

Many hallucinogens are taken orally,

LSD is absorbed directly either by placing it on the

- Tongue
- Placed on the skin

- When a substance is absorbed through the skin it is called transdermal absorption.

Substances that are dried and then eaten or brewed as a tea.

1. Peyote
2. Psilocybin Mushrooms
3. Jimson Weed
4. Morning Glory seeds

Ecstasy is usually taken orally.

Extreme care should be taken when handling suspected LSD blotter paper. LSD can be absorbed through the skin causing unintentional intoxication.

Gloves should be worn!
Additionally, users can consume hallucinogens by:

- Smoking
- Injecting
- Insufflation

Since most hallucinogens are taken orally, detecting any signs of ingestion may be difficult.

D. Effects of Hallucinogens

The user can feel a wide variety of effects when using hallucinogens.

The effects depend on the personality and expectations of the individual as well as the surroundings in which the drug is taken.

The drug generally intensifies the mood of the user at the time of ingestion.

If the user is depressed

- You could observe a deeper depression

If the user is feeling pleasant

- You could see a heightened pleasure.

Explain the terms used in the DEC Manual, “Bad Trip” or “Flash Backs”

Spend some tie discussing MDMA “Ecstasy”
Hallucinogens can uncover emotional flaws in the user. Therefore, the user may expect a pleasurable “trip”, but end up instead with a bad “trip”.

Flashbacks are not believed to be caused by a residual quantity of drug in the user’s body, but rather are vivid recollections of a previous hallucinogenic experience.

This can be similar to flashbacks associated with traumatic events.

E. General Indicators

Some of the physical, mental, and medical behaviors associated with Hallucinogens are:

- Hallucinations
- Paranoia
- Nausea
- Perspiring
- Dazed appearance
- Flashbacks
- Body tremors
- Uncoordinated
- Disoriented
- Memory Loss
- Synesthesia (mixing of the senses)
- Difficulty in speech
F. Eye Indicators

- HGN – Not Present
- VGN – Not Present
- LOC – Not Present
- Pupil Size – Dilated

G. Duration of Effects

LSD: 10 to 12 peak 4-6
Ecstasy: 1 to 3 hours
Psilocybin: 2 to 3 hours
Peyote: 30 min. to 2 hours

H. Overdoes Signs & Symptoms

The primary overdose symptom for the hallucinogen category is a long and intense “bad trip.”

I. Medical Conditions that mimic Hallucinogen impairment

There are two conditions that may mimic impairment by a hallucinogen. These may be, but are not limited to:

- High fever
- Mental illnesses

Complete Matrix Chart for the Hallucinogen Category
### I. Dissociative Anesthetic

Phencyclidine, along with its analogs, forms a distinct category all by themselves.

The chemical name for DA is Phenyl Cyclohexyl Piperidine.

An analog of a drug is one with a similar chemical composition. Analogs have slightly different chemical structures but produce the same effects.

DA symptoms may be confused with individuals under the influence of hallucinogens, stimulants and depressants.

If a thorough assessment is not performed, the examiner may jump to an incorrect conclusion.

- Give examples of these categories that mimic DA.
- High temperature with stimulants (sweating)
- HGN with depressants
- Blank stare of DA mimicking hallucinogens

### II. Identification of Dissociative Anesthetic

PCP was originally manufactured as an intravenous anesthetic. It was marketed under the trade name of Sernyl.
Although the drug proved to be a very effective anesthetic, it was discontinued for human use in 1967 because of very undesirable side effects.

Ketamine (Ketalar) is an analog of DA and is still used in pediatric and animal surgery.

DXM is found in over-the-counter anti-tussive medicines like Robitussin, Coricidin, Cough & Cold and Dimetapp

III. Methods and Signs of Ingestion

DA can be ingested by:

- Orally
- Insufflation
- Transdermally
- Eye Drops
- Smoked
  - Most Common form of ingestion is smoking in cigars, cigarettes, and marijuana

IV. Effects of Dissociative Anesthetic

The predominant effect of PCP is as a dissociative anesthetic.

This means a DA has the ability to cut off the brain’s perception of the rest of the body’s senses.
This sense is so strong that many users feel their head is actually separated from their body.

Another, more dangerous, effect of a DA is the user’s increased pain threshold.

The user is impervious to the same pain sensations that would typically render an impaired person incapacitated.

One should be extremely cautious when dealing with an individual impaired by a DA.

V. General indicators:

- Perspiring
- Blank stare
- Cyclic behavior
- Chemical odor
- Increased pain threshold
- Incomplete verbal responses
- Warm to the touch
- Repetitive speech
- Hallucinations
- Confused
- Possibly violent and combative
- “Moon walking”
VI. Eye Indicators

- HGN Present
- VGN Present
- Pupil Size Normal
- LOC Present

VII. Duration of Effects

PCP 4 to 6 hours
Ketamine 30 – 45 minutes (injected)
         45 – 60 minutes (snorted)
         1– 2 hours (orally)
DXM 3 - 6 hours

The duration of general effects may vary according to dose and whether the drug is injected, snorted, smoked or taken orally.

There is often a prolonged recovery period following the dissipation of the general effects.

VIII. Overdose Signs & Symptom

The overdose symptom/s for the DA Category:
- Deep Coma up to 12 hours
- Seizures and convulsions
- Respiratory depression
- Magnification of pre-existing cardiac conditions
- Eyes generally open with blank stare
- Possible psychosis
IX. Conditions That May Mimic Drug Impairment

Mental illnesses may mimic impairment by DA.

Complete Matrix Chart for the Disassociative Anesthetic Category

I. Narcotic Analgesic

Drugs in the narcotic analgesics category relieve pain.

They induce euphoria, alter moods, and produce sedation.

Narcotic Analgesics are also included in the opiate family and are legal prescription medications as well as illegal drugs.

This category is known for its physically addicting properties and severe withdrawal symptoms

II. Identification of Narcotic Analgesic

The most familiar narcotic analgesic is heroin.

Depending on the purity, heroin may be
• White powder to a
• Dark brown powder/tar color

Other narcotic analgesics include:
• Hydrocodone
• Vicodin
• Lortab
• Tylenol 3 (with codeine)
• Darvocet
• Morphine
• Oxycontin

Typically, these are prescription drugs and found in pill form.

The shape, size, or scoring can depend on the manufacturer or milligram strength.

In most cases, narcotic analgesics are obtained in local pharmacies and sold locally.

These drugs are inexpensive and frequently prescribed, but nevertheless remain a controlled substance.

III. Methods and Signs of Ingestion

Methods of ingestion vary, depending on the drug used.
### IV. Effects of Narcotic Analgesic

Narcotic analgesics are usually very addictive.

This means the person must receive a dose of the drug at regular intervals or physical withdrawal may result.

Narcotic analgesics also enable the person to develop a tolerance to the drug.

Each time the drug is taken, a larger dose is required to achieve the same feeling.

### V. General Indicators

- Droopy eyelids
- “On the nod”
- Drowsiness
- Depressed reflexes
- Dry mouth
- Low, raspy, slow speech
- Euphoria
- Fresh puncture marks
### VI. Eye Indicators

- HGN: Not Present
- VGN: Not Present
- Pupil Size: Constricted
- LOC: Not Present

### V. Duration of Effects

The duration of narcotic analgesics can vary from one type to another.

Dosage amounts, age, weight, tolerance, and other variables may dictate the length of actual impairment.

<table>
<thead>
<tr>
<th>Medicine</th>
<th>Duration</th>

### VI. Overdose Signs

Overdose signs and symptoms of a narcotic analgesic may include, but are not limited to:

- Slow and shallow breathing
- Clammy skin
- Coma
- Convulsions
VII. Conditions that may Mimic Drug Impairment

There are several conditions that may mimic impairment by a narcotic analgesic. These may be, but are not limited to

- Fatigue
- Very recent head injuries
- Diabetic reactions
- Hypotension (low blood pressure)
- Severe depression

Complete Matrix Chart for the Disassociative Anesthetic Category

I. Inhalants

Inhalants vary widely in terms of the chemicals involved and the specific effects they produce.

Inhalants are one of the most accessible and inexpensive substances of abuse due to their legitimate applications.

They are relatively inexpensive as well as readily available the home, school, or work environment.
II. Identification of Inhalants

There are three major categories of inhalant abuse.

1. Volatile solvents

These chemicals are usually inhaled directly from their source.

Some of these include:

- Gasoline
- Paint thinners
- Fingernail polish remover
- Cleaning fluid
- Dry erase markers
- Whiteout
- Paint
- Airplane glue

2. Aerosols

These chemicals are discharged from pressurized containers by propellants or compressed gas.

These are usually inhaled from a secondary source such as a:

- Soaked rag
- Paper bag
- Plastic bag

Some of the commonly abused aerosols include:

- Hair sprays
• Deodorants
• Vegetable frying pan lubricants
• Insecticides
• Spray paint

3. Anesthetic gases.

This category is the least abused of the three, mainly because of the expense and unavailability. Anesthetic gases are drugs which allow the user to disassociate pain and are generally used for medical procedures involving surgery.

These can be inhaled from the source directly.

Some of the anesthetic gases include:

• Chloroform
• Whipped cream (gas)
• Amyl nitrite
• Butyl nitrite
• Isobutyl nitrite
• Nitrous oxide

III. Methods and Signs of Ingestion

Spray paint and other inhalants:

• Can be sprayed into an empty soda can
• Inhaled through the opening in the top,
### AIDS LESSON PLAN

<table>
<thead>
<tr>
<th>Slide 93</th>
<th>Slide 94</th>
<th>Slide 95</th>
</tr>
</thead>
</table>
| • Sprayed into a balloon and inhaled, | • Soaked in a cloth (scrunchies/socks) and placed on the nose/mouth and inhaled. | • Confusion  
• Flushed face  
• Intense headaches  
• Bloodshot, watery eyes  
• Lack of muscle control |

Persons abusing inhalants will frequently have the abused substance on their:

- Hands
- face
- mouth

### IV. Effects of Inhalants

The effects of inhalants will vary widely depending on the substance inhaled.

Typically the inhalant abuser will generally appear to be intoxicated on alcohol.

Inhalant abusers can be detected and distinguished from other drug abusers because they will usually carry a chemical odor of the inhaled substance about their breath and person.

### V. General Indicators
• Odor of substance
• Non-communicative
• Disorientation
• Slurred speech
• Possible nausea
• Residue of substance around mouth and nose

VI. Eye Indicators

- HGN Present
- VGN Present (High Doses)
- Pupil Size Normal (May be Dilated)
- LOC Present

VII. Duration of Effects

Volatile Solvents 6-8 hours
Anesthetic Gases Very Short
Nitrous Oxide < 5 Minutes
Amyl Nitrite and Butyl Nitrite Few seconds to 20 minutes

VIII. Overdose Signs & Symptoms

The primary overdose sign for an inhalant is coma or “sudden sniffing death.” This is where the individual stops breathing from inhaling a substance. This may occur during the first experience with an inhalant.
IX. Conditions that May Mimic Drug Impairment

There are two conditions that may mimic impairment by an Inhalant. These may be, but are not limited to:

- Severe head injuries
- Inner ear disorders / Equilibrium

Complete the Matrix Chart for the Narcotic Analgesic Category

I. Cannabis

Cannabis is a category of drugs derived primarily from various species of plants, such as the Cannabis Sativa and Cannabis Indica.

The drugs in this category are the most widely abused illicit drugs.

They can be extremely impairing even thought they are often believed to be fairly benign.

The primary psychoactive ingredient in cannabis is:

- Delta-9 Tetrahydrocannabinol (THC)

THC is found primarily in the leaves and flower of the marijuana plant.
Different varieties of cannabis contain various concentrations of THC.

Marijuana is usually found as green leaves.

It is typically packaged in plastic baggies, 35 mm film containers, or other small devices.

II. Identification of Cannabis

The cannabis category includes:

- Marijuana
- Hash
- Hash oil
- Synthetic drug, such as dronabinol or marinol.

Marijuana is the most common and well-known of the drugs in this category, but there are other forms as well.

- Marinol, a synthetic form of cannabis, has a legitimate medicinal use as an anti-vomiting agent, commonly associated with cancer chemotherapy.
- Other forms are used for glaucoma patients or as an appetite enhancer for anorexia disorders.

The effects of cannabis depend on the strength of the THC in the dose consumed.
THC concentrations decades ago, peaked at relatively low levels (3-6%), however,

- Current levels are being reported at more than 30%.

The increase in THC levels is due to hybridization and better cultivation techniques used by producers.

III. Methods and Signs of Ingestion

Marijuana is usually rolled into cigarettes and smoked.

Since these cigarettes lack a filter, small bits and pieces of marijuana debris may be found stuck between the teeth of the user.

Burn marks may be found on the thumb and index finger.

The user may also use a “water pipe” or “bong” to smoke marijuana.

There are several chemicals in marijuana smoke.

Some of these chemicals are water soluble (meaning they combine with the water) and some are not (THC).

THC Bonds to fat molecules and may be in the urine toxicology reports for up to 30 days. (Explain)
By passing the marijuana smoke through the water, the smoke is not only more pure, but also cooler.

It can be baked in brownies or brewed into a tea and ingested.

IV. Effects of Cannabis

People under the influence of cannabis may not to be able to:

- Pay attention or
- May have a very brief attention span.

The subjective effects can vary considerably, but they will exhibit divided attention impairment.

The consequences of this in the classroom may be obvious, but the consequences when driving can be fatal.

V. General Indicators

- Marked reddening of the conjunctiva
- Odor of marijuana
- Marijuana debris in the mouth
- Body tremors
- Increased appetite
- Relaxed inhibitions
- Disoriented
- Possible paranoia
- Impaired perception of time and distance
- Eyelid tremors

VI. Eye Indicators
- HGN Not Present
- VGN Not Present
- Pupil Size Dilated (May be normal)
- LOC Present

VII. Duration of Effects

When marijuana is smoked, the user will experience peak effects
- Within 10 to 30 minutes.

Typical marijuana users usually exhibit the effects 2 to 3 hours, with most behavioral and physiological effects dissipating after 3-6 hours.

Some research suggests that residual effects can impact specific behaviors for up to 24 hours.

Dronabinol has an onset of 30 minutes to 1 hour with peak effects occurring between 2 and 4 hours.

It can stimulate appetite for up to 24 hours.
VIII. Overdose Signs & Symptoms

Overdose signs and symptoms of cannabis may include, but are not limited to:

- Paranoia
- Fatigue

X. Conditions that May Mimic Drug Impairment

Generally speaking, cannabis impairment will not be confused with any other medical condition as noted in the other drug categories.

However, a person diagnosed with an attention deficit disorder may mimic a cannabis user’s inability or unwillingness to pay attention.

Complete the Matrix Chart for the Cannabis Category

SESSION VII

DRUG COMBINATIONS
Session VII  The Effects of Drug Combinations

Upon successfully completing this session, the student will be able to:

1. Describe the prevalence of drug and alcohol use (individually & in combination) as well as poly drug use

2. Define poly drug use

3. Articulate possible effects of poly drug use related to the general indicators of alcohol and drugs

<table>

<td></td>
</tr>
</tbody>
</table>
I. Effects of Drug Combinations

Upon successfully completing this session, the student will be able to:

1. Describe the prevalence of drug and alcohol use (individually & in combination) as well as poly drug use.

2. Define poly drug use.

3. Articulate possible effects of poly drug use related to the general indicators of alcohol and drugs.

II. Prevalence of Drug and Alcohol Use

Define Poly Drug Use:

When a person ingests two or more different drug categories. Each drug works independently, but what the body will exhibit, however, is a combination of these effects.

Research has shown that:

- Alcohol is the most popular "mixer" with other drugs
- Cannabis is another popular "mixer", and frequently shows up in combination with Cocaine, Disassociative Anesthetics, and various other drugs
• The "speedball", a combination of Cocaine and Heroin, remains popular

Law enforcement officers should not be surprised to encounter virtually any possible combination of drugs.

Law enforcement officers may find more poly-drug users than single drug users.

This means that if the law enforcement officer is to do a good job at interpreting the results of observations, they must understand the basic mechanisms of drug interaction.

This session will help the participant appreciate the effects of poly-drug use.

III. Potential Effects of Poly Drug Use

Four types of combined effects can, and generally will occur when two or more drug categories are used together.

Null Effect

The simplest way to explain the null effect is using the phrase:

“Zero plus zero equals zero”

Give examples of NULL Effect.

Stimulants and Narcotic Analgesics do not affect LOC
When a subject consumes one drug which does not cause HGN and they also ingest another drug which does not cause HGN, then the officer should not expect to see HGN.

Another example of the null effect is the pupil size of a suspect who was under the influence of DA and a CNS depressant.

DA does not affect pupil size and neither does CNS depressants. The combination of these drugs will not affect the size of the pupils.

If neither drug affects some particular indicator of impairment, then their combination also will not affect that indicator.

Overlapping Effect

The overlapping effect comes into play when one drug does affect an indicator of impairment and the other drug has no effect on that indicator.

"Something plus nothing equals something"

Examples:

Narcotic analgesics typically cause

- HGN Not present
- VGN Not present
CNS Depressants typically cause

- HGN  Present
- VGN   Possibly Present
- Pupil Size  Normal
- LOC               Present

This specific combination can present four different overlapping effects.

The following illustrates the likely effects of the combination of a CNS Depressant and a Narcotic Analgesic:

- HGN  Present
- VGN   Possibly Present
- Pupil Size  Constricted
- LOC               Present

“Action plus no action equals action”

Additive Effect

The additive effect occurs when two drug categories affect the same indicator in the same way.
In other words, the effects ‘add together’ or reinforce each other to produce a greater effect than one of the drugs could produce individually.

If an officer observes general indicators related to a depressant and an inhalant:

- Both of which may cause HGN and VGN.

Based on the combination on these two drugs:

- We might expect to see more pronounced HGN and/or VGN than we might observe with a subject impaired by either a CNS depressant or an inhalant alone.

The simplest way to explain the additive effect:

"**Action plus action equals greater action**"

One thing we can't say for certain is how much the two drugs will reinforce each other.

Sometimes the reinforced effect is as simple as "one plus one equals two", while other drug combinations may produce a combined effect, which is greater than the individual combinations of the two drugs

"**One plus one equals five**"
For the purpose of this course, we use the term additive effect to cover all situations where two drugs impact an indicator in the same way.

Examples:

Alcohol typically causes:
- HGN Present
- VGN Possibly present
- Pupil Size Normal
- LOC Present

CNS Depressants typically cause:
- HGN Present
- VGN Possibly present
- Pupil Size Normal
- LOC Present

The additive effects may cause the indicators to be exaggerated.
“Action plus action equals a greater action”

Antagonistic Effect

An antagonistic effect occurs when two drug categories affect an indicator in exactly the opposite ways.

For example:

- Stimulant use results in dilated pupils while narcotic analgesics cause the pupils to be constricted.
- An officer may observe normal, constricted, or dilated pupils due to the antagonistic effect.

When we deal with an antagonistic effect, we cannot always predict the outcome effect.

The effects you will see will be dependant on which drug is more psychoactive in the system at any given time.

Example:

- If the stimulant is the psychoactive drug in the system, the pupils may be dilated.
- If the narcotic analgesic is more psychoactive drug, the pupils may be constricted.

Explain or give an example of Stimulant and Narcotic Analgesic.
• If the drugs are acting on the system in an equal manner you may see normal pupils.

”Action plus opposite action may be unpredictable”

IV. Summary

The actual effects can depend on a number of factors including, but not limited to:

• Dose levels
• Time of ingestion
• A subject's metabolism

Drug Combinations:

In order to illustrate the possible effects of drug combinations, the following examples will show a cumulative drug symptomatology matrix for two different drug combinations.

DA and Heroin in combination.

Cannabis and Stimulant in combination.

A person may have taken an oxycontin tablet before smoking crack.
One hundred twenty minutes

SESSION VIII

PRE & POST ARREST PROCEDURES
Session VIII Pre & Post Arrest Procedures

Upon successfully completing this session, the student will be able to:

1. Describe the three phases of the detection process: vehicle in motion, personal contact and pre-arrest screening
2. Describe effective roadside interview techniques
3. List the elements of the offense of DUID
4. Identify the indicators of impairment observed during the three phases of the detection process
5. Accurately document, in the proper event sequence order, observed impairment in each of the three phases of the detection process
6. Identify additional resources to support prosecution
7. Articulate relevant evidence as it relates to case preparation and prosecution

## I. Pre and Post Arrest Procedures

Upon Completion of this session the student will be better able to:

- Describe the three phases of the detection process: vehicle in motion, personal contact and pre-arrest screening
- Describe effective roadside interview techniques
- List the elements of the offense of DUID
- Identify the indicators of impairment observed during the three phases of the detection process
- Accurately document, in the proper event sequence order, observed impairment in each of the three phases of the detection process
- Identify additional resources to support prosecution
- Articulate relevant evidence as it relates to case preparation and prosecution

Although this course is designed to make the student aware of:

- Impairment of drugs
- Alcohol or a combination of drugs and alcohol,
The mission is also to reinforce skills which, taught in previous courses dealing with:

- Active observation
- Effective documentation
- Articulation
- Courtroom testimony

To effectively gather and present the collective evidence as part of a DWI arrest and prosecution, the law enforcement officer, prosecutor and other supporting professionals must consider information in terms of the totality of the evidence.

We will look at the collection and articulation of evidence in terms of the three phases of DWI detection.

- Vehicle in Motion
- Personal Contact
- Pre-Arrest Screening
- Post-Arrest procedures

A. What is DWI Detection?

DWI detection will be defined as:

- The entire process of identifying and gathering evidence to determine whether or not a suspect should be arrested for impaired driving attributed
to alcohol, drug or a combination of alcohol and drugs.

The detection process:
- When does it begin?
- Yes - do it now
- Wait - look for additional evidence
- No - Don’t do it

1. When the law enforcement officer attention is first drawn to a vehicle.

2. The detection process ends when the officer decides that there is or there is not sufficient probable cause to arrest the suspect for DWI.

The officer’s attention may be drawn to a particular vehicle or individual for a variety of reasons.

The precipitating event may be:
- A loud noise

activities. Increase in fatal crashes, etc…

? Ask class, What are some examples of things that would draw your attention to a vehicle.

Refer to the NHTSA Driving clues. “Visual Detection of DWI Motorists”

DWI arrests can be initiated through any contact with motorist.

Most vehicle stops do not begin with suspicion of
### AIDS

<table>
<thead>
<tr>
<th>LESSON PLAN</th>
<th>NOTES</th>
</tr>
</thead>
</table>
| • An equipment or moving violation  
• Behavior that is unusual, but not necessarily illegal  
• Almost anything else.  

Initial detection may or may not carry with it a suspicion that the driver is impaired.  

The detection process ends with:  
• An arrest  
• Release decision  

That decision, should ideally, be based on:  
• The totality of the evidence collected throughout each of the three phases.  

However, situations and circumstances may vary in a manner that could preclude the completion of all three phases.  

Examples of these circumstances would be:  
• Police pursuits  
• Motorist assists  
• Vehicle crashes  
• Traffic direction  
• Sobriety Checkpoints

**DWI.**

---

When the totality of the evidence is available.
Law enforcement officers should not leap to the arrest/no arrest decision, but rather proceed carefully through each of the three phases when possible.

This process helps to identify all the available evidence needed to make an arrest decision.

B. The three phases of the DWI Detection Process

1. In Phase One, you usually observe the driver operating the vehicle.

2. In Phase Two, after you have stopped the vehicle, there usually is an opportunity to observe and speak with the driver face-to-face.

3. In Phase Three, you usually have an opportunity to administer some field sobriety tests to the driver to evaluate whether there is any degree of impairment.

You may, depending upon your agency policies and state laws, administer a preliminary breath test in addition to field sobriety tests to verify that alcohol is or is not the cause or a contributing factor of the impairment.

The DWI detection process does not always include all three phases. Sometimes DWI detection occurs when Phase
One is absent, such as, cases in which you have no opportunity to observe the vehicle in motion.

Examples include:

- Crashes
- Sobriety checkpoint
- Motorist assistance.

Sometimes there are situations when Phase One does not occur.

Ask class if they can think of examples where phase one may not be present.

incidences where the officer does not observe Phase One.

Sometimes there are situations when Phase Two does not occur.

Examples include:

A crash where the driver(s) is transported to a hospital and significant time passes before an investigating officer makes contact with the driver.

Sometimes there are situations when Phase Three does not occur.

There are cases in which you would not or could not administer formal tests to the driver.

Examples include:

- Driver is impaired to the point they are unable to safely complete the tests
- Injured to the extent they are unable to complete the tests
- Refuses to submit to tests

This decision is made by the officer.
• Circumstances or other conditions that do not allow for the safe administration of field sobriety tests

Each detection phase usually involves two major tasks and one major decision. Each of the major decisions can have any one of three different outcomes:

1. Yes - Do it Now
2. Wait - Look for Additional Evidence
3. No - Don't Do It

**Phase One:**

Task 1 Observe the vehicle in operation.

*Decision Point: Is there reasonable suspicion to stop the vehicle?*

Task 2 Continue to observe the vehicle and the stopping sequence.

**Phase Two:**

Task 1 Observe and interview the driver face-to-face.

*Decision Point: Should you instruct the driver to step from the vehicle for further investigation*

Officer should follow their departmental policy governing traffic stops and investigations.

*Give examples of what should be used:*

- SFST (including VGN), Romberg, LOC, Pupil observation.

---

*Decision Point: Is there sufficient probable cause to arrest the driver for DWI?*

Task 2 | Arrange for or administer appropriate biological test. |  |

C. Effective Roadside Interviews Techniques

This evidence is critical to the successful prosecution of DWI case.

In order for the law enforcement officer to gather valuable information during the detection process, they must learn and practice effective roadside interview techniques.

Examples would include:

1. What you say – Word choice, communication style

*Ask students for some examples of appropriate word choices?*
Word choice example: crash or accident

Communication style

Example:

The gate of the questioning, tone of your voice.

2. What you do – Physical positioning, demeanor

Physical Positioning example:
Keeping officer safety in mind, avoid an over bearing posture or stance.

Demeanor example: maintain professionalism, facilitate open dialog.

3. What you see – Bloodshot eyes, clothing, paraphernalia, etc...
4. What you smell – Alcoholic beverage, chemical odors, marijuana, etc...

5. What you hear – slurred speech, unusual and/or inappropriate statements, drug lingo, etc...

D. Identifying and Documenting Observed Indicators of Impairment.

During the detection process, many different situations arise which can affect the identification and documentation of your observations.

It is the law enforcement officer’s responsibility to conduct a thorough and complete investigation.

Since case preparation begins with the observation of the vehicle, absent extraordinary conditions, short cuts in the three phases of detection process should not occur.

Officers should follow up on all observations that indicate impairment to determine whether impairment is present and if that impairment is due to alcohol, drugs, or a combination of both.

During phase two of the detection process, a driver may offer a reason for their behavior or physical appearance.
Example:

- The reason they were weaving was because they were adjusting the radio.

- The reason their eyes are glassy is because they worked a double shift.

At this point you should draw on your training and experience to determine:

1. If impairment is present
2. What is causing the signs have observed
3. If more information is needed to make a determination

**Remember**

If you don’t record the evidence, it didn’t happen.
This determination, similar to the decision to arrest, is rarely based on one observation or factor. Rather these decisions are usually based on the totality of the circumstances.

The signs, symptoms and general indicators discussed during this course are meant to assist law enforcement officers in recognizing impairment based on alcohol, drugs or a combination of both.

Again, remind the students they are not DRE Certified and do not have the knowledge or skill base to categorize impairment with a specific drug category.
Additionally, it is intended to assist criminal justice professionals with understanding impairment based on alcohol, drugs or a combination of both.

The information presented as part of this course is not intended nor meant to equip the officer with the knowledge or ability to categorize the impairment observed with a specific drug category.

In an effort to help the student learn what types of observations may be important as part of the detection process, we have included a matrix which lists many common indicators of impairment.

It is suggested that officers use this matrix or another documentation tool as a field reference.

The matrix will help the officer to organize their observations during the traffic stop.

In addition to documenting the indicators, the officer should take care to articulate the circumstances and environment in which the stop was conducted.

This descriptive information will paint a picture for the prosecutor and the court, thereby presenting the evidence in an effective fashion.

This refers to the matrix that is provided in this course.

There is a DRE matrix; however this matrix contains information that is outside the scope of this training course.
F. Case Preparation and Prosecution

Case preparation begins with the first observations of the vehicle during Phase I of the detection process.

Although state DWI/DUID statutes are different and the legal requirements necessary to prove each element of the offense differs from state to state, the detection process remains the same.

Therefore, regardless of what the statute requires, it is important that law enforcement officers understand both the elements of the state statutes and what evidence the prosecution needs to prove each element.

During the detection process, it is critical that officers keep in mind the legal requirements of their state. It is equally important that the officer organize and document their observations in terms of the three detection phases.

By doing this, you will assist the prosecutor in case preparation and presentation in court. A successful prosecution for impaired driving begins with building a DWI Prosecution Team.
The most important part of this process is to remember that it does not matter who leads the effort.

The most significant benefit of the team is more comprehensive case preparation and a more effective prosecution.

- What does that mean – DWI Prosecution Team?
- Who is on that team?
- Why is the officer’s word and observations not enough?
- Does this mean more work?
- How does this help me do my job?

The foundation for a strong DWI Prosecution team is the relationship between the law enforcement officer(s) involved with the arrest and the prosecuting attorneys associated with the case.

Effective communication and a clear understanding of each group’s objectives and expectations are essential to the success of the DWI prosecution team.

Additionally, toxicologists, breath testing professionals, DREs and other expert witnesses provide specific details that help build the case as well as support the law enforcement officer’s testimony during the
We often forget about the other potential members of the team who are not directly part of the case preparation.

This section will use the word process to describe the sequence of activities and actions which take place during a DWI traffic stop, arrest, and prosecution.

This word is not used by accident.

It is important for the students in this course to begin to view DWI enforcement and prosecution as a process which can be continually improved and refined.

It is rational to believe that every DWI traffic stop, arrest and prosecution are different, but it is also reasonable to assume that there are common elements each time an officer encounters an impaired driver and a prosecutor prepares a DWI case.

If we can concentrate on common elements and work to optimize how we handle them, then we can be better prepared for court and common defense strategies and challenges.

We must work together to utilize this team in order to follow a similar protocol with each case. Remember,
“Consistency Yields Reliability.”

Throughout this course, we have discussed information in terms of the three phases of DWI detection process.

### What is a Case File?
- All Observations
- All Evidence
- Potential Witness List
- Chemical Test Results
- Photos, Diagrams, Scene Sketch
- Other?

Remember: Comprehensive Case Prep Yields Effective Courtroom Presentation

### Phase I: Vehicle in Motion
(Observation of the suspect’s driving)

Preparation for trial begins with the first observation of the vehicle in motion, which is usually the first point of attack.

In some cases, the reasonable suspicion for the traffic stop may not be associated with driving behavior consistent with the impairment, for example an equipment violation.

Therefore, all observations during the vehicle in motion phase should be noted in order to illustrate the environment to the court later.
Potential team members involved at this point may include:

- The law enforcement officer who observed the driving and/or made the traffic stop

- Other law enforcement officers who may have made observations or were called in to assist

- Lay witnesses, including other people in the vehicle or other motorist.

Law enforcement officers should note every observation made regarding driving. This include observations before an after you activate you emergency equipment.

If there is a crash involved, the officer probably will not actually observe driving. Therefore, witnesses to the crash should be noted to prove state specific statutory requirements.

**Phase II: Personal Contact**

(Observations of the suspect after the stop)

Preparation for trial continues with the traffic stop. Observations made before and after the suspect exits the vehicle should be documented.
**Example:**

- Odor of alcohol
- Slurred speech
- Red glassy eyes
- Inappropriate responses
- Using the vehicle for support during exit and/or while walking

Accurate documentation is essential due to the length of time cases are adjudicated.

Potential team members involved at this point may include:

- Law enforcement officer(s) who observed the subjects following the traffic stop
- Other law enforcement officers who may have made observations or were called in to assist
- Lay witnesses, including other people in the vehicle or other motorist

Law enforcement officers should note every observation made regarding personal contact. This includes your observations before and after the subject exits the vehicle.
Documenting and articulating these observations can reinforce the reasonable suspicion for the stop.

**Phase III: Pre-Arrest Screening**

(Observations of the suspect while performing all sobriety tests)

Preparation for trial continues with the officer conducting pre-arrest screening.

Observations made during HGN, WAT, OLS and other sobriety tests, including the associated clues must be thoroughly documented.

Example:

During the WAT test, the suspect may not count their steps out loud while walking.

- This is considered an observation.

The suspect may start walking before being instructed to do so.

- This is considered a clue.

Potential team members involved at this point may include:

- Law enforcement officer(s) who conducts the field sobriety tests
• Other law enforcement officers who may have made observations or were called in to assist

• Lay witnesses including other people in the vehicle or at the scene

Law enforcement officers should note every observation made regarding pre-arrest screening.

This includes observations before, during and after the field sobriety tests. Recording and articulating these observations can reinforce the reasonable suspicion for the arrest.

G. Post Arrest Screening

During post arrest screening the team will potentially include:

1. Breath testing operators/technical supervisors.

2. Drug Recognition Experts (DREs)

3. Medical personnel

4. Jail personnel

A DRE should be utilized whenever available. The officer should document which DRE was contacted, when they were contacted, and when they arrived for the evaluation.
If a DRE is not available at the time of arrest, they may still be useful at trial to bridge the gap between the observations made by the arresting officer and any biological test results.

H. Pre-Trial Preparation

For this reason, it remains essential to document, in detail, all observations including those made after arrest.

As preparation for trial begins the team should expand.

Additional team members should include:

- **Local prosecutor**

- Toxicologist or representative from the appropriate state or contract lab

- DRE Officer / DRE State Coordinator

- Traffic Safety Resource Prosecutor (TSRP) (If available)

You should encourage your local prosecutors to participate in ride-a-longs and witness DRE evaluation. This knowledge will enable them to better understand the processing of impaired drivers.
When possible, at a minimum, the local prosecutor and the arresting officers should meet to discuss the details of the case and determine potential prosecution strategies.

The toxicologist in a DEC state can be used to corroborate the testimony of the DRE.

The DRE/DRE State Coordinator may be able to assist in identifying additional DRE resources.

In a non-DEC state, the toxicologist can be used to bridge the gap between the observations of the arresting officer and the lab report.

If your state has a TSRP they can be utilized as a resource to assist both prosecutors and law enforcement.

NTLC, the NAPC Prosecutor Fellow, and NHTSA may also serve as additional resources.

I. Trial

At trial, it is imperative that the prosecutor, arresting officer, DRE (if applicable), toxicologist
and any other witness avoid using legal, law enforcement or medical specific language.

The use of “plain English” assists the judge, jury and others who are involved in the case to understand the specifics of all testimony.

The team must work together to illustrate the entire process. Visual aids should be used to illustrate the location of the stop, physical appearance of defendant, and/or performance on the field sobriety tests.

Visual aids may also assist in explaining the officers training and experience, factual concepts, and/or the legal elements of the offense.

Remember, visual aids engage the judge/jury and increase retention of information.

From the time of the traffic stop through post arrest screening, and remain a consistent team until after the case is adjudicated.

The prosecutor may be added to the team at any time. Ideally, the prosecutor would be on board immediately, especially in the case of serious injury or fatal crashes.
### Final Exam Case Studies and Scenarios

Apply the information you have learned during this course in order to effectively document observations offered in the written scenarios and case studies.

The student must complete the following for each of the scenarios/case studies as well as appropriately answer the questions posed on the form itself:

1. Describe the process of assessing the impaired driver in the context of the traffic safety related scenarios/case study.

2. Evaluate scenario/case study information:
   - How you analyzed the information/observations and describe what the results indicate.

3. Be prepared to articulate observations related to the general indicators of impairment and the basis for that interpretation.

Case scenarios are in the administrative guide.
